## Guide to WATER, Part 1

SEE? RAIN IS NO PROBLEM WHEN YOU HAVE AN UMBRELLA.

3

- Method:**
- Pour water in the cup and place the lid on top.
  - Place one hand on the lid and turn it upside down.
  - Remove your hand and place the lid on top.
  - Color the cup and place it upside down.
- Materials:**
- Water
  - Cup
  - Plastic lid or a piece of cardboard

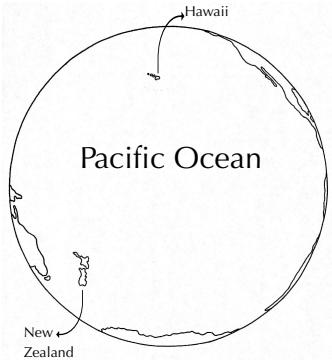

### 1. Gravity Defying Lid

Water is the **only** thing on our planet that exists naturally in all three states of matter—as a solid, liquid, and a gas.

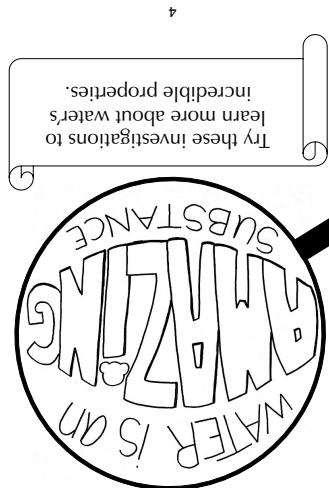

Gaseous water, or water vapor, is invisible. You can't see it, but it's in the air around you and we call it **humidity**. The more water vapor in the air, the more humid it is.

The only other things on earth that come close to existing in all three states of matter are mercury, acetic acid, and carbon dioxide. While all three states of matter are **possible** for each of these, they don't occur **naturally**. Water, on the other hand? It's everywhere.

Oceans cover most of the surface of the earth, and at any given time about 50-70% of the planet is covered by another form of water: clouds.

2

That's why we call it **H<sub>2</sub>O**

WHAT EXACTLY IS WATER?  
It's 1 oxygen atom plus 2 hydrogens.

TRY THESE INVESTIGATIONS TO LEARN MORE ABOUT WATER'S INCREDIBLE PROPERTIES.

Now we know about water's properties.

## 2. Magic Screen

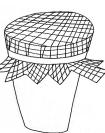

### Materials:

- Water
- Lid
- Canning jar with a metal ring
- A piece of screen or other mesh fabric

### Method:

- Fill jar to rim and secure screen over the top.
- Cover with lid and flip over.
- Remove lid and observe.

No jar? No problem! Just use a cup and rubber band. But be sure the screen or mesh is FLAT and TIGHT across the rim of the cup.

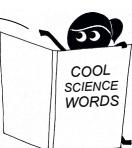

7

8

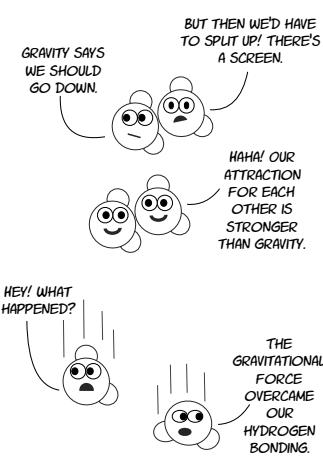

### HOW DOES IT WORK? Cohesion.

THAT MEANS WATER MOLECULES LIKE TO STICK TOGETHER!

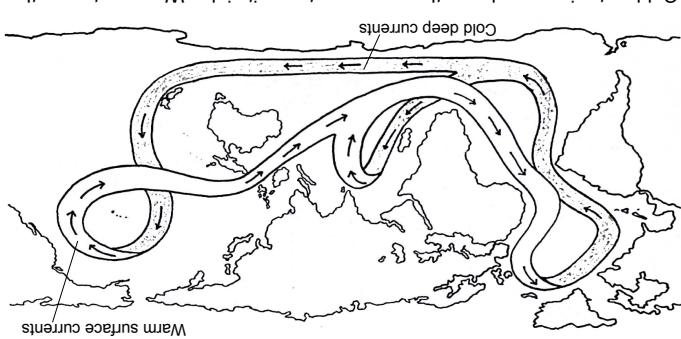

The water molecules are sticky, or cohesive. They are attracted to each other and the jar and the screen. That attraction is strong enough that they effectively form a "lid" on the bottom of the jar, just like the plastic lid did in the first investigation. If air doesn't come in, the water can't go out. So the water stays inside—until you shake or tip the jar. If you do either of those things, then gravity wins.

9

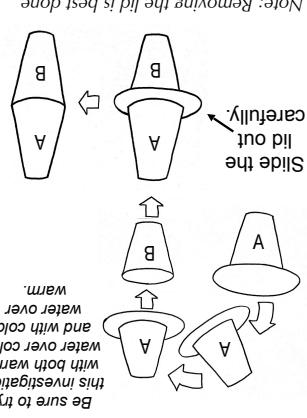

10

Cold water is more dense than warm water so it sinks. Warm water, on the other hand, rises or "floats" on top. This phenomenon drives the global circulation in the oceans—a massive system of currents that slowly but steadily circulates all the water in the oceans and strongly influences both marine life and the earth's climate.

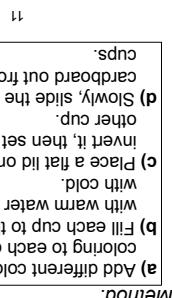

13

Note: Removing the lid is better done steadily while the other pulls out the lid.

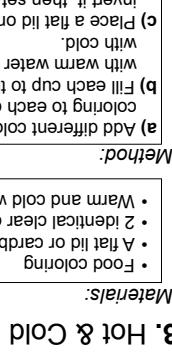

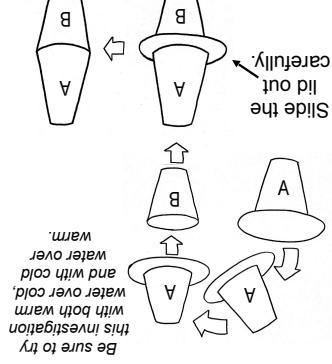

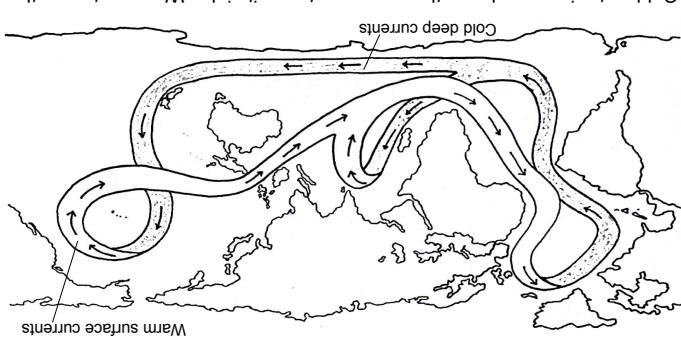

12

11

Be sure to try this investigation with both warm water over cold water and with cold water over warm water.
