

Lesson Summary

Here are two different strategies for writing the equation of a line using two given points.

Strategy Using a Table

First, calculate the slope using a table. Next, substitute the coordinates of one of the points into the equation $y = mx + b$ to determine the y -intercept. Then write the equation in the form $y = mx + b$.

$$\begin{array}{|c|c|} \hline x & y \\ \hline 1 & 8 \\ \hline 3 & 2 \\ \hline \end{array}$$

$+2$ -6

slope: $\frac{-6}{2} = -3$

$$y = -3x + b$$

Substitute $(1, 8)$ in for x and y .

$$8 = -3(1) + b$$

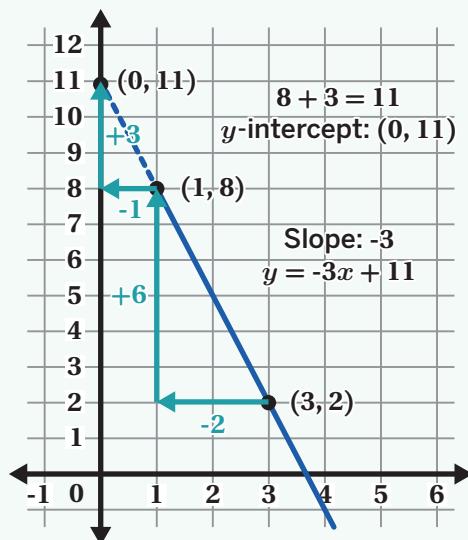

$$8 = -3 + b$$

$$11 = b$$

$$y = -3x + 11$$

Strategy Using Slope Triangles

Draw a line and use similar triangles to determine the slope and y -intercept of the line. Then write the equation in the form $y = mx + b$.

Things to Remember:

Lesson Practice

Name: Date: Period:

- 1.** Bao and Maia are each writing an equation of the line that passes through the points $(2, 9)$ and $(12, 14)$. They both calculate the slope as $\frac{1}{2}$.

- Bao substitutes the point $(2, 9)$ to determine the y -intercept.
- Maia substitutes the point $(12, 14)$ to determine the y -intercept.

Here is each student's work and their solutions for the y -intercept. Determine any mistakes in each student's work and explain how you would fix them.

Bao

$$y = \frac{1}{2}x + b$$

$$9 = \frac{1}{2}(2) + b$$

$$9 = 1 + b$$

$$b = 8$$

Maia

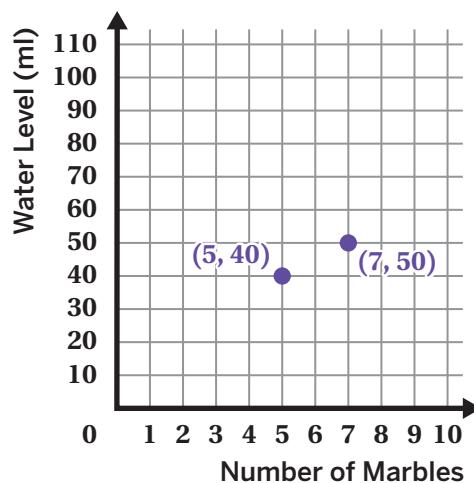

$$y = \frac{1}{2}x + b$$

$$12 = \frac{1}{2}(14) + b$$

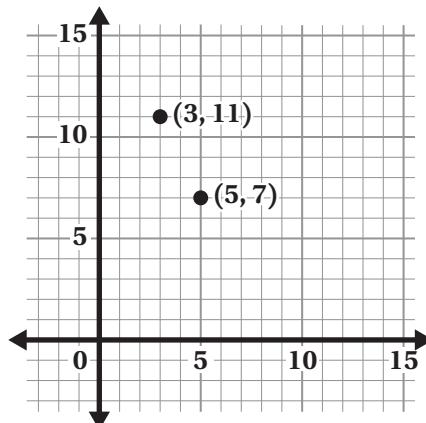

$$12 = 7 + b$$

$$b = 5$$

- 2.** Chloe added marbles to a container of water. When she added 5 marbles, the water level was 40 millimeters. When she added 7 marbles, the water level was 50 millimeters. Write an equation for the water level, y , after x marbles are added. Show or explain your thinking.

- 3.** Here is a graph showing the points $(3, 11)$ and $(5, 7)$. What is the y -intercept of the line that passes through these points?

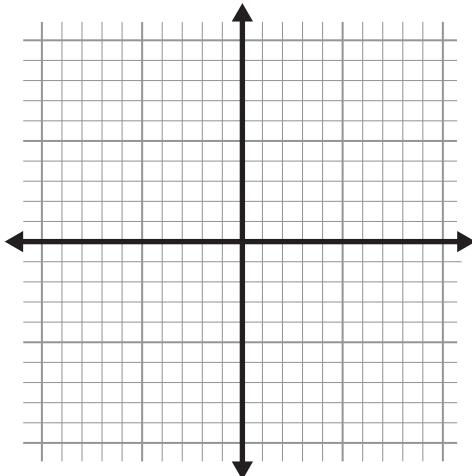

Lesson Practice

8.3.11

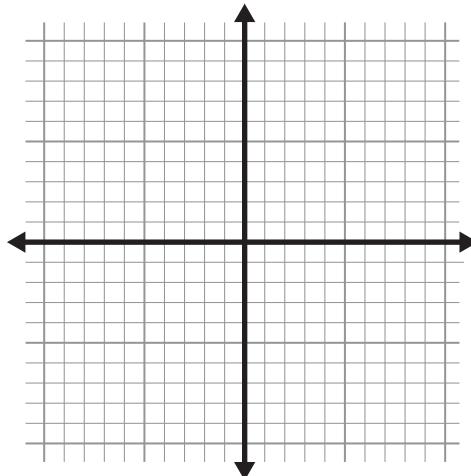

Name: Date: Period:

Problems 4–5: Write the equation of the line that passes through each pair of points. Show your work, and use the coordinate plane if it helps with your thinking.

4. (2, 14) and (6, 26)

5. (-5, 7) and (1, 1)

6. A line has a slope of 2 and passes through the point (-6, 1). Which is the equation of that line?

- A. $y = 2x + 4$ B. $y = 2x + 13$ C. $y = 2x + 8$ D. $y = 2x - 11$

Spiral Review

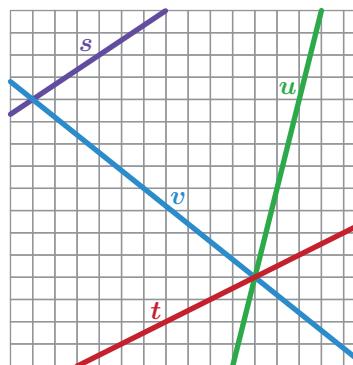

Problems 7–10: Determine if the slope of each line is positive or negative.

7. Line s

8. Line t

9. Line u

10. Line v

Reflection

- Put a question mark next to a problem you're feeling unsure of.
- Use this space to ask a question or share something you're proud of.

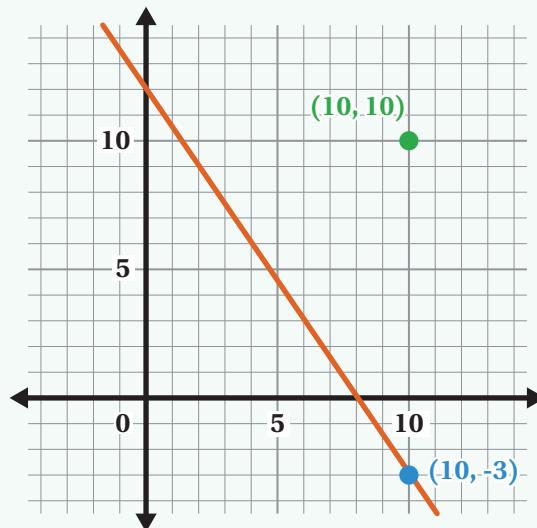

Lesson Summary

A **solution** to an equation with two variables is a set of values that makes the equation true. Solutions are often written as an ordered pair, (x, y) .

Every point that lies on a line is a solution to that equation. Points that do not lie on the line are *not* solutions to the equation.

Here is a graph of the linear equation $3x + 2y = 24$.

- $(10, -3)$ is a solution to the equation $3x + 2y = 24$ because the point is on the graph of the line, and because $3(10) + 2(-3) = 24$.
- $(10, 10)$ is *not* a solution because the point is not on the line, and because $3(10) + 2(10) = 50$, not 24.
- Although we can't see it on the graph, $(-10, 27)$ is also a solution because $3(-10) + 2(27) = 24$.

**Things to Remember:**

Lesson Practice

8.3.12

Name: Date: Period:

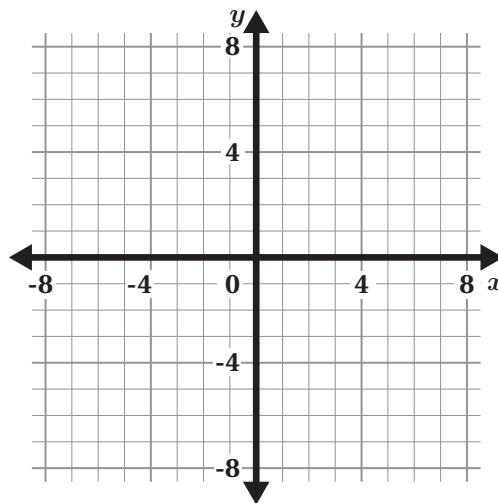

1. Select all of the ordered pairs (x, y) that are solutions to the linear equation $2x + 3y = 6$.

- A. $(0, 2)$ B. $(0, 6)$ C. $(2, 3)$
 D. $(3, -2)$ E. $(3, 0)$ F. $(6, -2)$

2. The graph of a linear equation passes through the points $(-4, 1)$ and $(4, 6)$.

Select *all* the points that are also solutions to this equation. Use the graph if it helps with your thinking.

- A. $(0, 3.5)$
 B. $(8, 5)$
 C. $(12, 11)$
 D. $(-6, 0)$
 E. $(5, 6)$

3. Match each equation with its solutions.

Equation	Solutions
a. $2x + 3y = 7$ $(-3, -7), (0, -4), (-1, -5)$
b. $3x = \frac{y}{2}$ $\left(3\frac{1}{2}, 0\right), (-1, 3), \left(0, 2\frac{1}{3}\right)$
c. $x - y = 4$ $(14, 21), (2, 3), (8, 12)$
d. $y = -x + 1$ $(0.5, 3), (1, 6), (1.2, 7.2)$
e. $y = 1.5x$ $\left(\frac{1}{2}, \frac{1}{2}\right), \left(\frac{1}{4}, \frac{3}{4}\right), \left(\frac{1}{8}, \frac{7}{8}\right)$

4. Determine whether the following statement is *true* or *false*. Explain your thinking.

The ordered pairs $(6, 13)$, $(21, 33)$, and $(99, 137)$ all lie on the line whose equation is $y = \frac{4}{3}x + 5$.

Lesson Practice

8.3.12

Name: Date: Period:

5. Here is a linear equation: $y = \frac{1}{4}x + \frac{5}{4}$.

Are (1, 1.5) and (12, 4) both solutions to this equation? Explain your thinking.

Problems 6–7: Complete each table.

6. $y = \frac{2}{3}x$

x	y
-3	
	2

7. $y + x = 5$

x	y
-3	
	2

Spiral Review

8. This table represents a linear relationship.

Write an equation in the form $y = mx + b$ that represents this relationship.

x	y
2	20
4	15
8	5

9. Deja adds \$20 to her bus card. Every time she rides the bus, \$2 is subtracted from the amount available on her card. After x rides, there are y dollars left on the card. Write a linear equation that represents this relationship.

Reflection

- Circle the problem you think will help you most on the End-of-Unit Assessment.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

The four representations of a linear relationship — table, graph, equation, and verbal description — are all useful when solving real-world problems.

Let's say a coach has a \$120 budget to buy dinner for their team. Pizzas cost \$20 and sandwiches cost \$8. x represents the number of pizzas bought and y represents the number of sandwiches bought.

This situation can be modeled by the linear relationship $20x + 8y = 120$.

Here are two ways to show that 4 pizzas and 5 sandwiches is one solution to the equation:

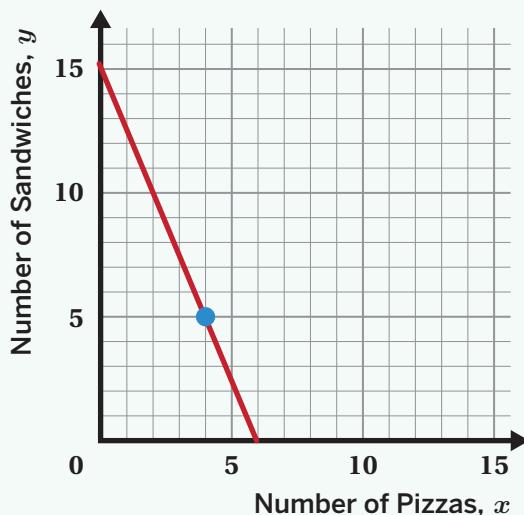

- The values $x = 4$ and $y = 5$ make the equation true.

$$20(4) + 8(5) = 120$$

$$80 + 40 = 120$$

$$120 = 120$$

- The point $(4, 5)$ is on the graph of the linear relationship.

**Things to Remember:**

Name: Date: Period:

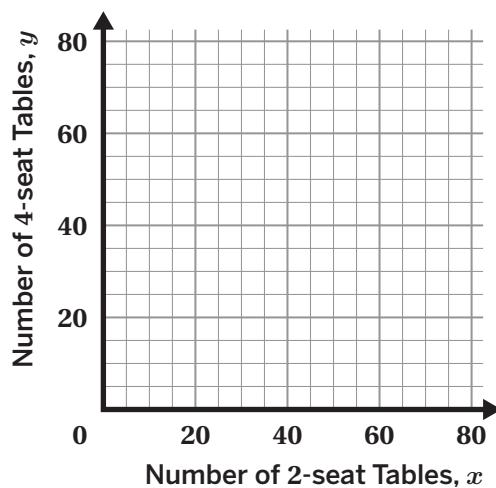

Problems 1–5: The owner of a new restaurant is ordering tables and chairs. She wants to have only tables for 2 and tables for 4. The total number of people that can be seated in the restaurant is 120.

1. Complete the table to show some possible combinations of 2-seat tables and 4-seat tables that will seat 120 customers.

Number of 2-Seat Tables	Number of 4-Seat Tables
.....
.....
.....
.....

2. Write an equation that represents the number of 2-seat tables, x , and the number of 4-seat tables, y , that the owner can order.

3. Graph all the possible combinations of 2-seat and 4-seat tables that will seat 120 customers.

4. What is the slope of the line? What does it tell you about the situation?

5. What are the x - and y -intercepts of the line? What do they represent in the situation?

Lesson Practice

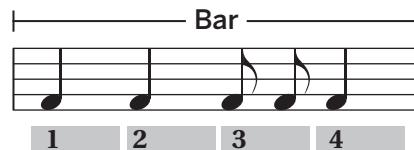

8.3.13

Name: Date: Period:

Problems 6–7: A bar is a section of music made up of notes. A quarter note is 1 beat long. An eighth note is $\frac{1}{2}$ a beat long. A music composer wants to create a bar that's 4 beats long.

6. What are two possible combinations of eighth notes ($\frac{1}{2}$ a beat long) and quarter notes (1 beat long) that they could use to make a bar that's 4 beats long? Use a graph if it helps with your thinking.

Eighth Note **Quarter Note**
 = $\frac{1}{2}$ beat  = 1 beat

7. Write an equation to represent the number of eighth notes, x , and number of quarter notes, y , in a bar that has a total of 4 beats.

Spiral Review

Problems 8–10: Here is the graph of a linear relationship.

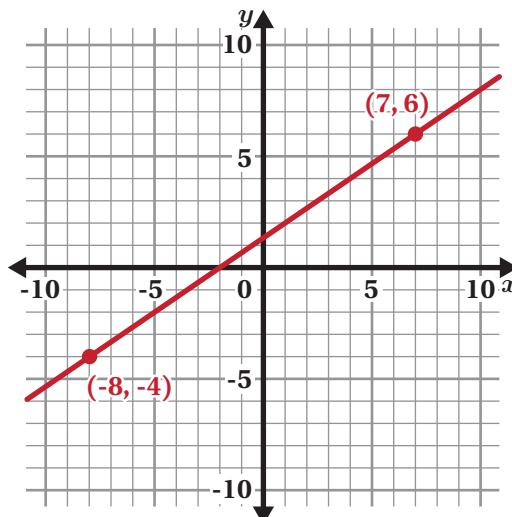

8. What is the y -intercept of the line?

- A. $\frac{4}{3}$ B. $\frac{3}{4}$
C. $\frac{2}{3}$ D. $\frac{3}{2}$

9. What is the slope of the line?

- A. $\frac{4}{3}$ B. $\frac{3}{4}$
C. $\frac{2}{3}$ D. $\frac{3}{2}$

10. Write an equation that represents the line.

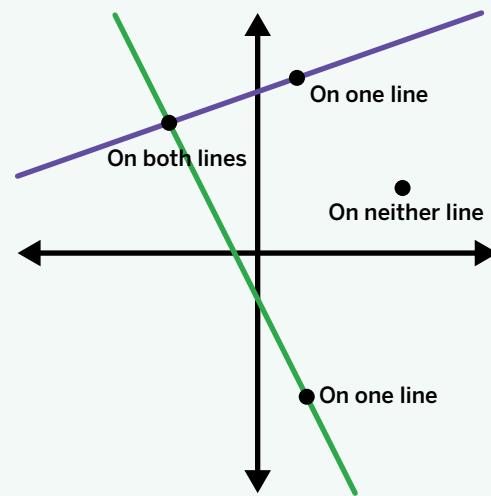

Reflection

- Put a star next to your favorite problem.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

Linear relationships can represent many situations. Lines graphed on the same coordinate plane can simultaneously represent multiple conditions or relationships involving the same variables.

- The coordinates of a point that is on both lines make both relationships true.
- The coordinates of a point on only one line make only one relationship true.
- The coordinates of a point on neither line make neither relationship true.

Things to Remember:

Lesson Practice

8.4.09

Name: Date: Period:

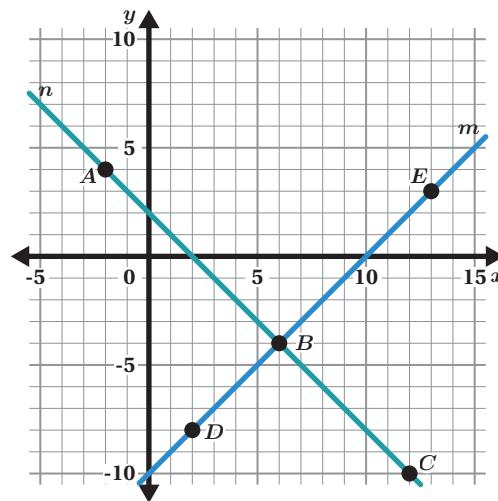

Problems 1–5: Here is a coordinate plane.

1. Determine which line represents this condition:
The coordinates of each point have a sum of 2.

2. Determine which line represents this condition:
The y -coordinate of each point is 10 less than the x -coordinate.

3. Select *all* the points whose coordinates have a sum of 2.

- A. Point A
 - B. Point B
 - C. Point C
 - D. Point D
 - E. Point E
4. Select *all* the points whose y -coordinate is 10 less than the x -coordinate.
- A. Point A
 - B. Point B
 - C. Point C
 - D. Point D
 - E. Point E
5. Select *all* the points whose coordinates have a sum of 2 and the y -coordinate is 10 less than the x -coordinate.
- A. Point A
 - B. Point B
 - C. Point C
 - D. Point D
 - E. Point E

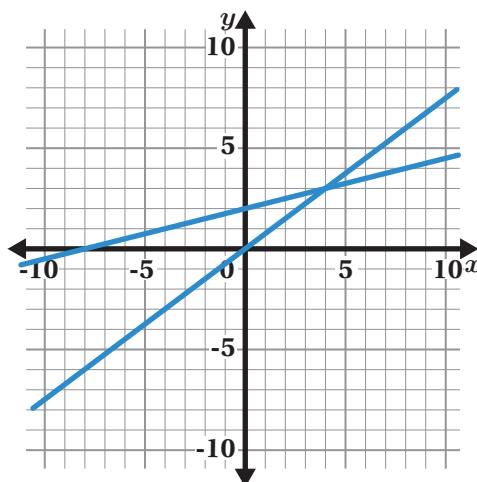

Lesson Practice

8.4.09

Name: Date: Period:

6. These two lines represent a system of equations. What is the y -coordinate of the point that makes both equations true?

- A. 0
- B. $\frac{1}{5}$
- C. 3
- D. 4

Spiral Review

Problems 7–9: Consider the equation $4x - 4 = 4x + \underline{\hspace{2cm}}$. What value or expression could you write in the blank so that the equation is true for:

7. No values of x ?

8. All values of x ?

9. One value of x ?

Reflection

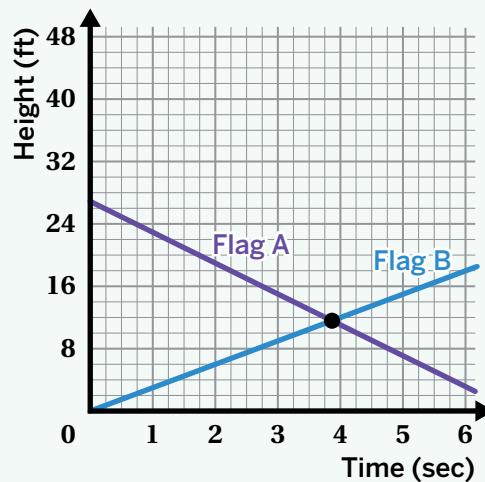

1. Circle the problem you enjoyed doing the most.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

If there are two equations that share the same variables, you can find the solution that makes both equations true by locating the **point of intersection**, where the two lines meet on a graph.

For example, consider this graph.

Although you can't see the exact values of the point of intersection, you can tell that the flags are the same height, at about 11.5 feet, just before 4 seconds.

Things to Remember:

Name: Date: Period:

5. The point where the graphs of two equations intersect has a y -coordinate of 2.

One equation is $y = -3x + 5$.

Determine the other equation if its graph has a slope of 1.

6. The graph of the equations $y = \square - x$ and $y = \square x - 3$ intersect at the point $(2, 1)$.

Determine the missing values in the equations. Show or explain your thinking.

Spiral Review

Problems 7–9: Determine whether each equation is true for *one value*, *all values*, or *no values* of x .

7. $10 + 3x = -4.2x + 9$

8. $5(4x + 1) - x = 19x + 5$

9. $-2(3x - 7) = -6x + 12$

Problems 10–11: Determine whether $x = -1$ is a solution to each equation.

10. $1.5x + 2 = 8.5x - 4$

11. $\frac{1}{2} + 2x = \frac{1}{2}x - 1$

Reflection

1. Put a heart next to the problem you feel most confident about.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

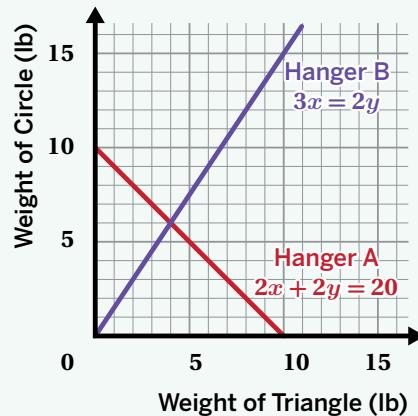

A **system of equations** is a set of two or more equations with the same variables that are meant to be solved together. It is sometimes shown with a single bracket around the equations.

A **solution to a system** of equations is a set of values that makes all equations in that system true.

For example, here is a system of equations:

$$\begin{cases} 2x + 2y = 20 \\ 3x = 2y \end{cases}$$

Hanger A

The ordered pair $(4, 6)$ is the point of intersection, which means that it will make both equations true. Both hangers will balance when the triangles weigh 4 pounds and the circles weigh 6 pounds.

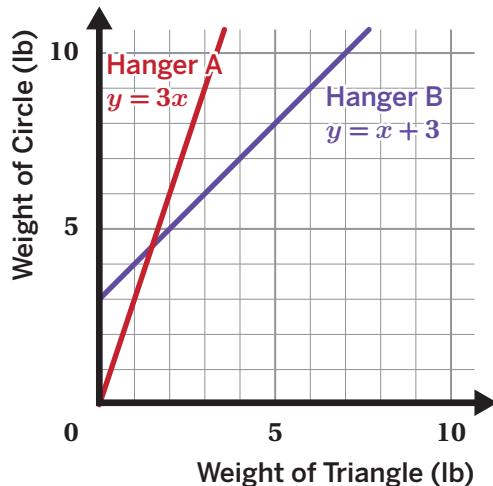

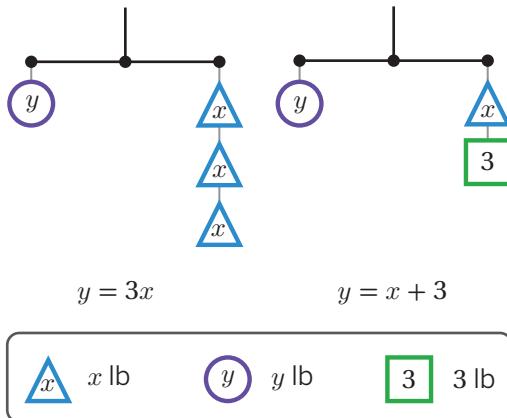

Things to Remember:

Lesson Practice

8.4.11

Name: Date: Period:

Problems 1–2: The hangers and the graph represent the same system of equations.

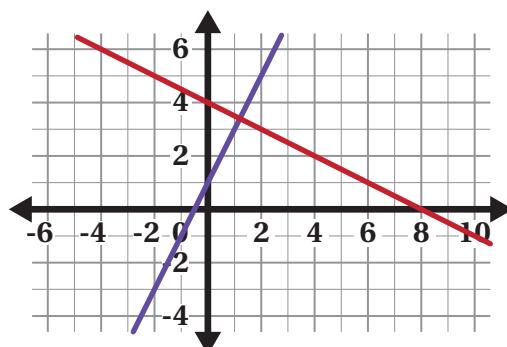

- Determine the solution to the system of equations.
- What does the solution tell you about the weight of a triangle and the weight of a circle that will balance the hanger?

Problems 3–4: Here is a graph.

- Write an equation that can represent each line.

- Estimate the solution to the system.

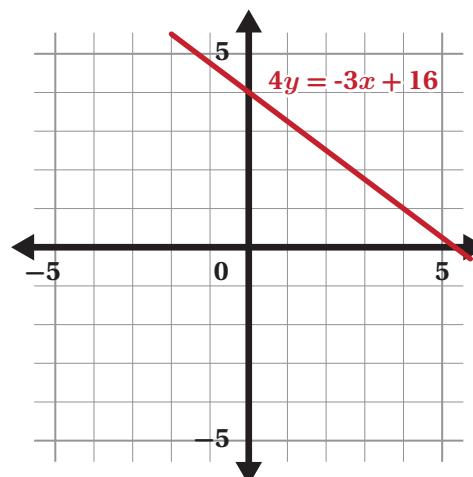

Lesson Practice

Name: Date: Period:

Problems 5–7: Here is a graph that represents one equation in a system of equations.

5. Write a second equation for the system so that it has infinitely many solutions.

6. Write a second equation whose graph goes through $(0, 1)$ so that the system has no solution.
7. Write a second equation whose graph goes through $(0, 2)$ so that the system has one solution: $(4, 1)$.

Spiral Review

8. Select *all* the equations that have no solution.

- A. $2 + 4(4x + 5) = 8x + 2x - 11$ B. $-x + 3x - 7 = 2(x - 7)$
 C. $7 - 5x(-3) = 5(3x - 2)$ D. $6x + 3(2x - 1) = 5x - 4 + 7x + 1$

Problems 9–10: Solve each equation. Show or explain your thinking.

9. $\frac{15(x - 3)}{5} = 3(2x - 3)$

10. $0.4(x + 7) = 0.2(x + 40) - 5.2 + 0.2x$

Reflection

- Put a star next to a problem you're still wondering about.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

For a point to be a solution to a system of equations, the x - and y -coordinates must make both of the equations true. This ordered pair is the *point of intersection* when the system is graphed.

For example, here is a system of equations:

$$\begin{cases} y = 4x - 5 \\ y = -2x + 7 \end{cases}$$

To determine the solution to the system, you can write a single equation by taking the two expressions that are equal to y and setting them equal to each other.

$$4x - 5 = -2x + 7$$

$$6x - 5 = 7$$

$$6x = 12$$

$$x = 2$$

You can then substitute the solution for x into either of the original equations to determine the value of y .

$$y = 4x - 5$$

$$y = 4(2) - 5$$

$$y = 8 - 5$$

$$y = 3$$

The solution to this system of equations is the point (2, 3).

Things to Remember:

Lesson Practice

6.
$$\begin{cases} y = 4x + 8 \\ y = 2x + 16 \end{cases}$$

7.
$$\begin{cases} y = -4x + 2 \\ y = 3x - 5 \end{cases}$$

8. Here is how Haru tried to solve this system of equations. Did Haru solve the system of equations correctly? Explain your thinking.

Haru

$$\begin{cases} y = -3x + 1 \\ x = 4 \end{cases}$$

$$\begin{aligned} -3x + 1 &= 4 & y &= -3(-1) + 1 \\ -3x &= 3 & y &= 4 \\ x &= -1 \end{aligned}$$

Solution: $(-1, 4)$

Spiral Review

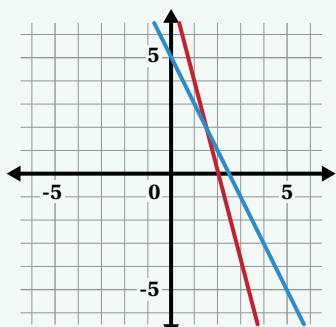

9. The temperature in degrees Fahrenheit, F , is related to the temperature in degrees Celsius, C , which is represented by the equation $F = \frac{9}{5}C + 32$. There is one temperature where the degrees Fahrenheit and degrees Celsius are the same, so that $C = F$. What is that temperature? Show or explain your thinking.

Reflection

1. Circle a problem you're still curious about.
2. Use this space to ask a question or share something you're proud of.

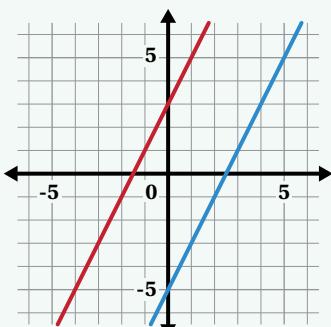

Lesson Summary

Systems of two linear equations can have one solution, no solution, or infinitely many solutions. You can determine the number of solutions to a system of equations by graphing, comparing the slopes and y -intercepts, or solving the system algebraically.

One solution:

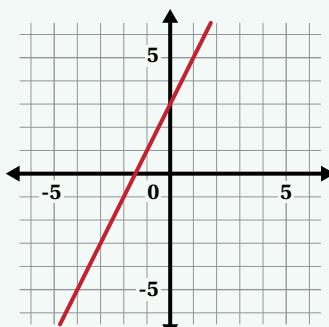

$$\begin{cases} y = -4x + 8 \\ y = -2x + 5 \end{cases}$$

- Different slopes

No solution:

$$\begin{cases} y = 2x + 3 \\ y = 2x - 5 \end{cases}$$

- Same slopes
- Different y -intercepts

Infinitely many solutions:

$$\begin{cases} y = 2x + 3 \\ y = 2x + 3 \end{cases}$$

- Same slopes
- Same y -intercepts

Things to Remember:

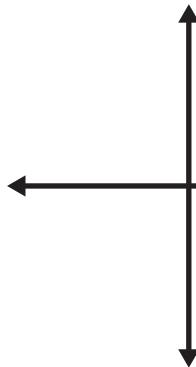

Lesson Practice

8.4.13

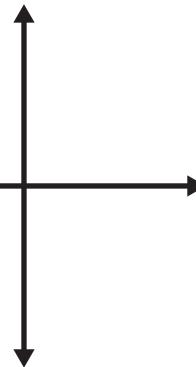

Name: Date: Period:

Problems 1–3: Sketch two lines that match each description. Then describe the number of solutions for each system of equations.

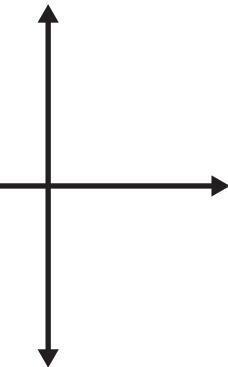

1. Two lines with the same slope and different y -intercepts.

2. Two lines with different slopes.

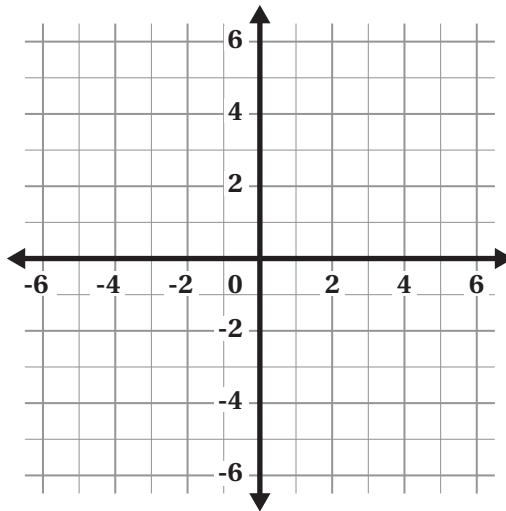

3. Two lines with the same slope and same y -intercept.

4. How many solutions does this system have?

$$\begin{aligned}y &= \frac{1}{4}x + 2 \\y &= 2x - 5\end{aligned}$$

Show or explain your thinking.

Problems 5–6: Consider this system of equations: $\begin{cases} x - 6y = 4 \\ 3x - 18y = 4 \end{cases}$

5. Change one number to make a new system with one solution.

6. Change one number to make a new system with an infinite number of solutions.

8.4.13

Name: Date: Period:

Problems 7–8: Ali and Sid graphed this system:

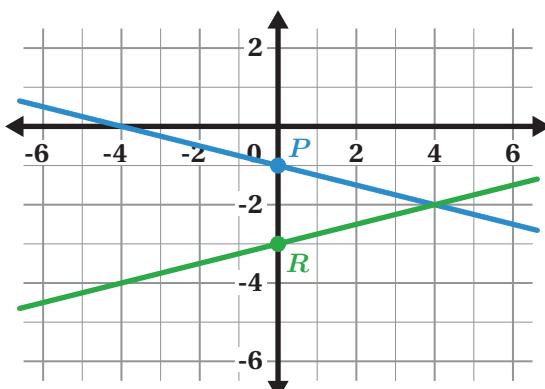

$$\begin{cases} y = -\frac{1}{4}x - 1 \\ y = \frac{1}{4}x - 3 \end{cases}$$

They marked its solutions with points P and R .

7. Which statement describes Ali and Sid's solutions?

- A. Their solutions are correct.
- B. They marked the y -intercepts instead of the intersection point of the two lines.
- C. They marked the y -intercepts instead of the x -intercepts.
- D. They marked only the y -intercepts instead of the x - and y -intercepts.

8. What is the solution to the system of equations?

Spiral Review

Problems 9–10: Solve each equation.

9. $\frac{3y - 6}{9} = \frac{4 - 2y}{-3}$

10. $0.3(x - 10) - 1.8 = 2.7x$

Reflection

1. Put a question mark next to a response you'd like to compare with a classmate's.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

An ordered pair (x, y) is a solution to a system of equations if it makes both equations true. If you know the value of one variable in one of the equations, you can substitute it into the other equation to solve for the second variable.

Here is a system of equations:

$$\begin{cases} y = 5x \\ 2x - y = 9 \end{cases}$$

Since $y = 5x$, you can substitute $5x$ for y in $2x - y = 9$, and then solve for x .

$$\begin{aligned} 2x - (5x) &= 9 \\ -3x &= 9 \\ x &= -3 \end{aligned}$$

You can then substitute the solution for x into either of the original equations to determine the value of y .

$$\begin{aligned} y &= 5x \\ y &= 5(-3) \\ y &= -15 \end{aligned}$$

The ordered pair $(-3, -15)$ is the solution to the system of equations.

7. A cylinder has a height of 6 feet and a diameter of 2 feet. Which measurement is closest to the volume of the cylinder in cubic feet?

- A. 226.2 cubic feet
- B. 75.4 cubic feet
- C. 18.8 cubic feet
- D. 113.1 cubic feet

Problems 8–10: This cylinder has a radius of 4 centimeters and a height of 5 centimeters.

8. What is the volume of the cylinder?

9. What is the volume of the cylinder when its radius is tripled?

10. What is the volume of the cylinder when its radius is halved?

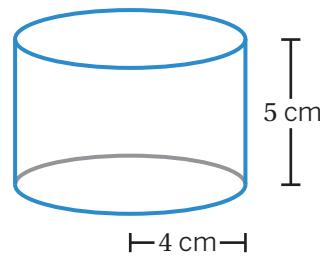

Figure may not be drawn to scale.

Reflection

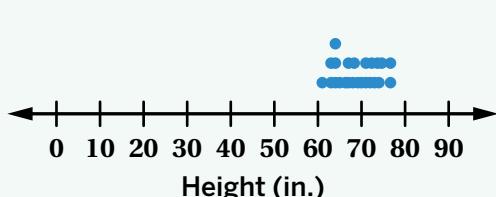

1. Star the problem you spent the most time on.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

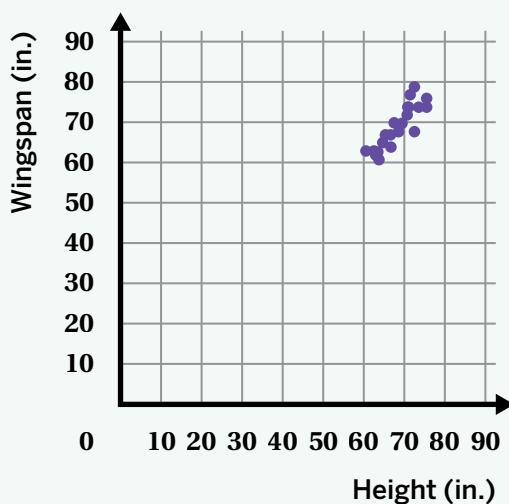

Data presented as numbers, quantities, or measurements that can be compared in a meaningful way is called *numerical data*, or *quantitative data*. You can investigate *univariate data*, which involves one variable, and *bivariate data*, which involves two variables.

There are different ways to represent numerical data. A *dot plot* shows data for one variable and a scatter plot shows data for two variables at the same time. Seeing two numerical variables at the same time allows us to notice trends and connections.

Dot Plot

Scatter Plot

Things to Remember:

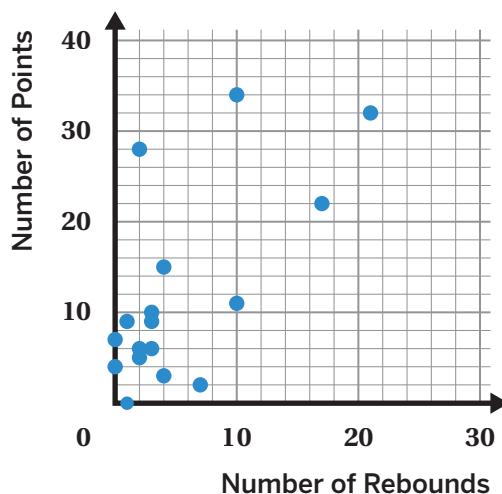

Lesson Practice

8.6.02

Name: Date: Period:

Problems 1–5: This scatter plot shows the number of rebounds and points for each player in a recent professional basketball game.

1. Circle the point on the graph that represents the player with the most rebounds. How many rebounds did that player have?
2. How many players had 0 rebounds?
3. What is another question you can answer based on this scatter plot?
4. What is a question you *cannot* answer based on this scatter plot?
5. The table shows the data for another basketball player. Plot the point for the player on the graph.

6. Which representation(s) are appropriate for comparing the heights of students on a volleyball team to the heights of students on a soccer team?
 - A. Scatter plot
 - B. Dot plots
 - C. Both

Explain your thinking.

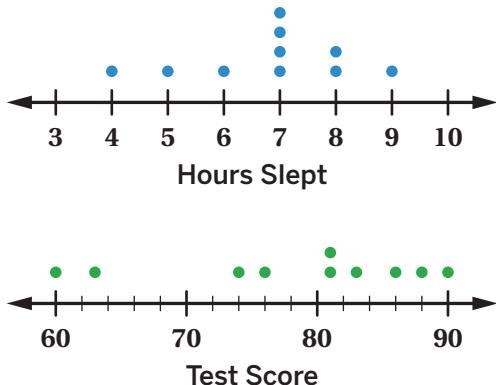

Lesson Practice

8.6.02

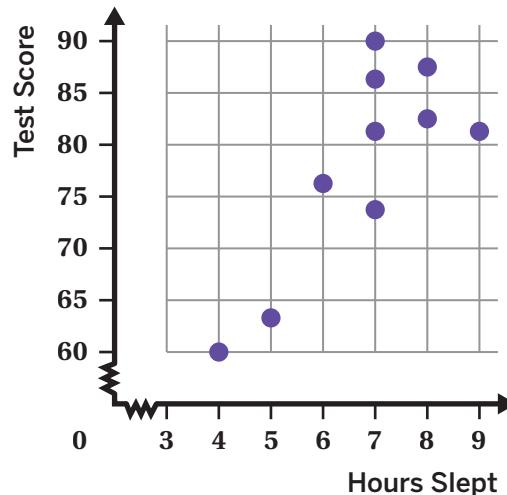

Name: Date: Period:

7. A teacher collected data about her students' test scores and how many hours they slept the night before a test. She represented the data with dot plots and a scatter plot.

Dot Plots

Scatter Plot

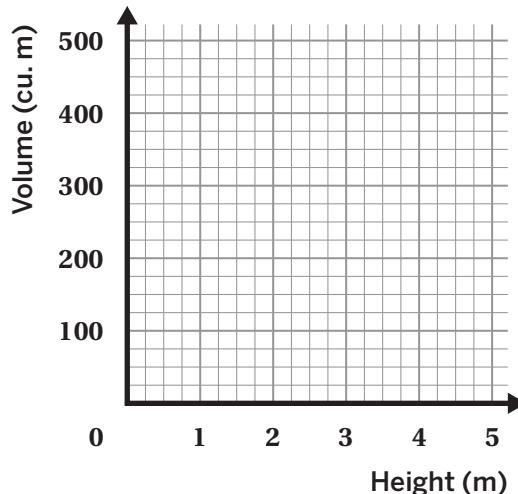

What is different about the two ways of representing the data?

Spiral Review

Problems 8–10: There are many cylinders with a radius of 6 meters. Let h represent the height in meters and V represent the volume in cubic meters.

8. Write an equation that represents the volume, V , as a function of the height, h .
9. Sketch the graph of the equation, using 3.14 as an approximation for π .
10. If you double the height of a cylinder, what happens to the volume? Use the equation to help you explain your thinking.

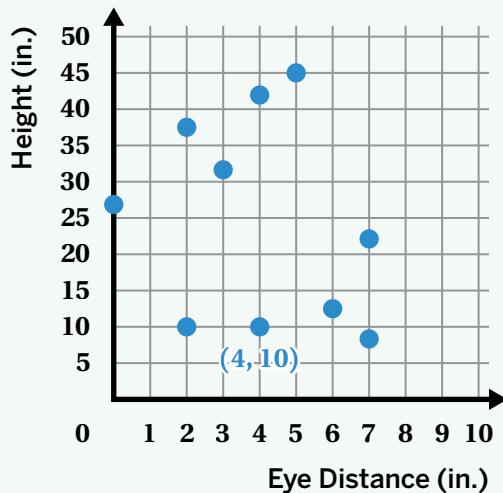

Reflection

- Put a question mark next to a response you'd like to compare with a classmate's.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

A point on a scatter plot represents two pieces of information. The axis labels tell you how to interpret the coordinates of each point.

In this example, the point $(4, 10)$ represents a robot with an eye distance of 4 inches and a height of 10 inches.

Things to Remember:

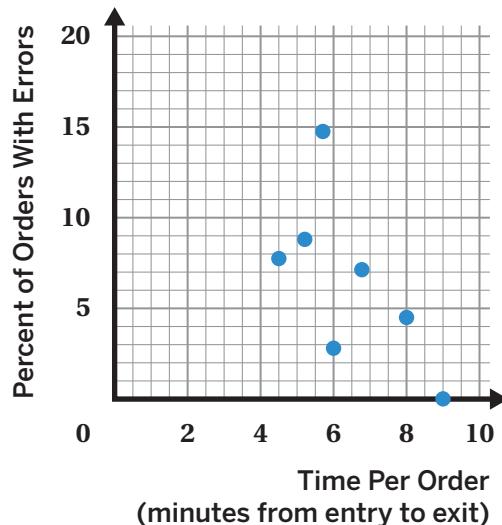

Lesson Practice

8.6.03

Name: Date: Period:

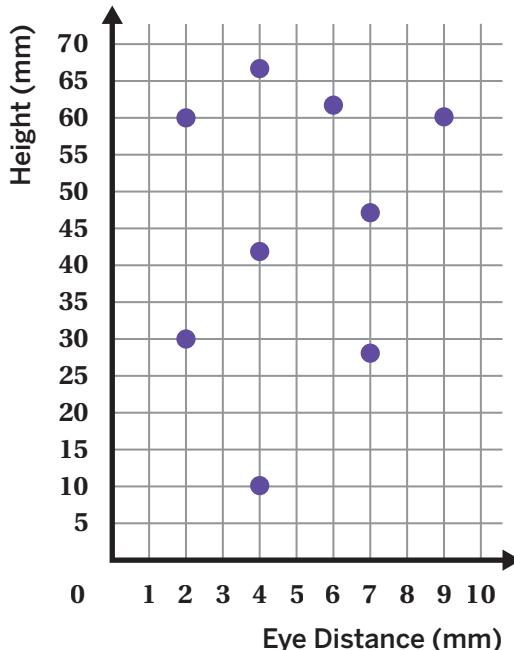

Problems 1–3: A study gathered data about different drive-thru restaurants. The table and scatter plot show the average time per order and the percent of orders with errors for each restaurant.

Restaurant	Time Per Order (min)	Percent of Orders With Errors
CraveBite	8	4.5
Taco Tango	6	2.8
Bite Master	9	0
Noodle Nest	4.5	7.7
Burger Whiz	5.2	8.8
Pajaro	6.8	7.1
NachoLoco	5.7	14.7

- Circle the point on the scatter plot that represents the data for NachoLoco.
- What does the point (6, 2.8) represent?
- In the same study, the data showed that Dumpling Delight takes 4.5 minutes per order and 13% of their orders had errors. Add a point to the scatter plot to represent Dumpling Delight.
- This scatter plot shows the height and eye distance of robots. Circle the point(s) for the robot(s) with the smallest eye distance. Write the height and eye distance of each point you circled.

Circle the point(s) for the robot(s) with the smallest eye distance. Write the height and eye distance of each point you circled.

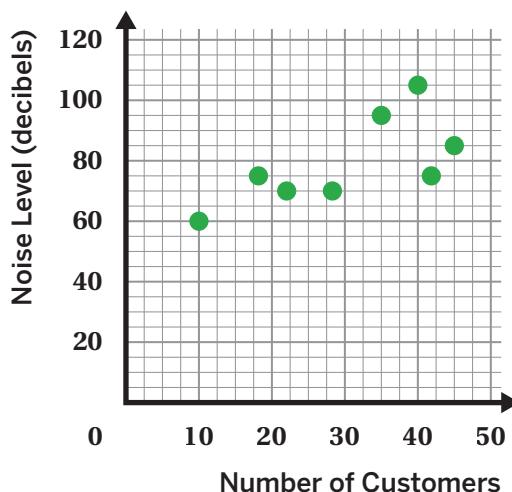

Lesson Practice

8.6.03

Name: Date: Period:

Problems 5–7: This scatter plot shows the noise level and the number of customers for eight restaurants.

5. What is the noise level at the loudest restaurant?
6. What is the noise level at the restaurant with the most customers?

7. The noise level at a restaurant with 35 customers is 80 decibels. Plot a point on the graph that represents this restaurant.
8. Select *all* the representations that are appropriate for comparing exam score to hours of sleep the night before an exam.
 - A. Histogram
 - B. Scatter plot
 - C. Dot plot
 - D. Table
 - E. Box plot

Spiral Review

Problems 9–12: Evaluate each expression.

9. $-2 \cdot (-4)$

10. $-7 \cdot 2$

11. $9 \cdot (-10)$

12. $-2 \cdot (-6) \cdot (5)$

Reflection

1. Put a star next to the problem you understood best.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

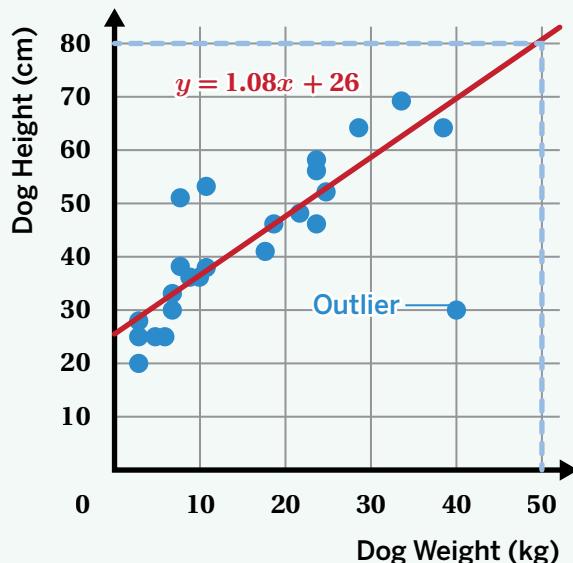

A **linear model** is a line on a scatter plot that helps identify trends in data more clearly.

You can also use a linear model to make a prediction.

For example, there are two ways you can use this linear model to predict a dog's height when it weighs 50 kilograms.

- Use the graph to locate 50 on the x -axis and follow it up to meet the linear model, which shows a y -value of 80. This means when the dog's weight is 50 kilograms, its height is 80 centimeters.
- Use the equation for the linear model, $y = 1.08x + 26$, by replacing x with 50 and evaluating for y , which is approximately 80 centimeters.

You can identify an **outlier** by looking for points that are far away from the other points and from the predicted values. The point (40, 30) is an outlier on the graph of dog weights and heights.

Things to Remember:

Lesson Practice

8.6.04

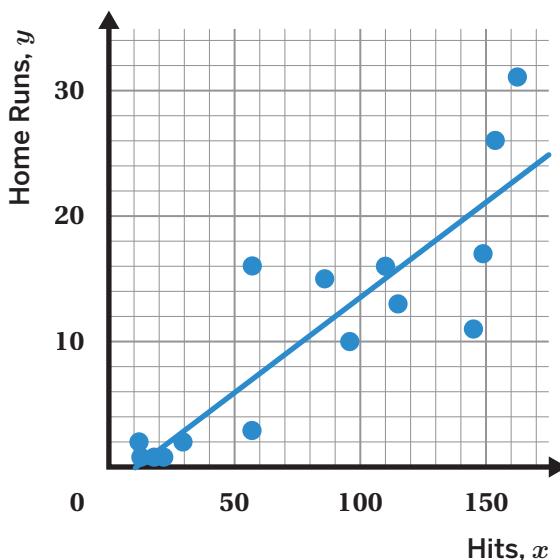

Name: Date: Period:

Problems 1–3: This scatter plot shows the number of hits and home runs for 15 baseball players last season and the linear model $y = 0.15x - 1.5$.

1. How many home runs did the player with 154 hits have?

2. If a player has 20 home runs, how many hits does the linear model predict they will have?

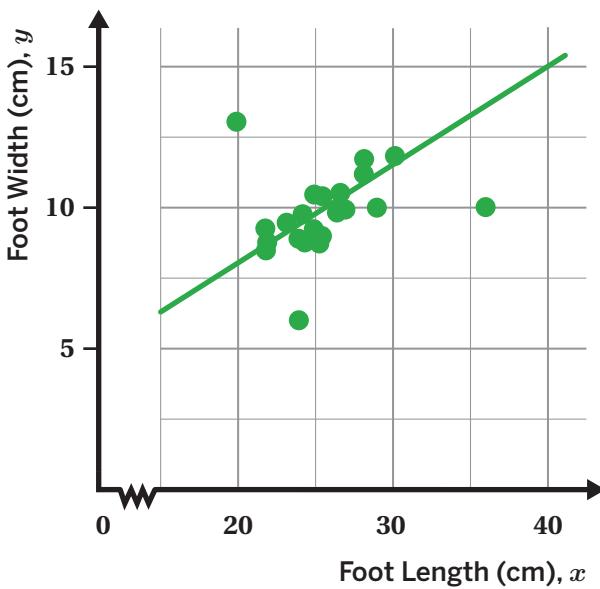

3. How many home runs does the linear model predict a player with 250 hits will have?

Problems 4–5: This scatter plot shows several foot lengths and widths, along with a linear model represented by the equation $y = 0.35x + 1$.

4. Use the linear model's equation to predict the width of a foot that is 50 centimeters long.

5. Does the scatter plot appear to have any outliers? If so, circle them and describe what they represent about foot length and foot width.

6. In your own words, what does an outlier represent?

Lesson Practice

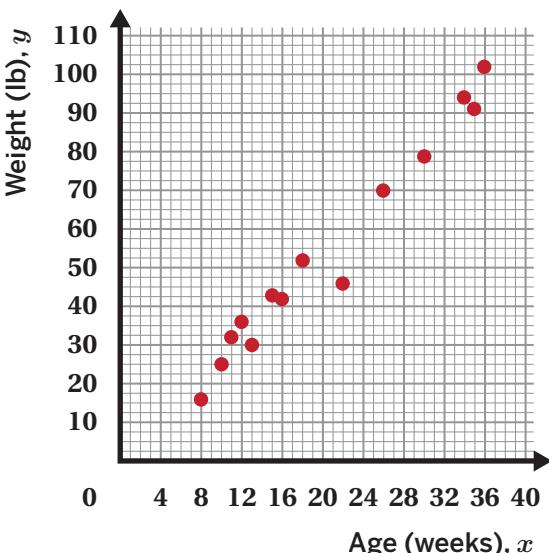

8.6.04

Name: Date: Period:

7. This scatter plot shows the weight and age for many dogs of a certain breed.

Which is the best prediction for the weight of a dog that is 24 weeks old?

- A. 10 pounds
- B. 45 pounds
- C. 60 pounds
- D. 90 pounds

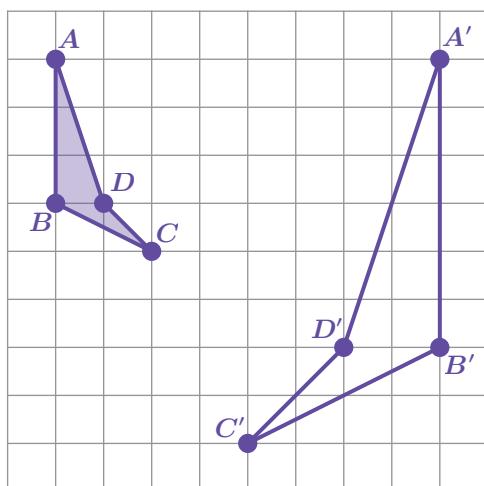

Spiral Review

Problems 8–9: Solve each system of equations. Write the solution as an ordered pair. Show your thinking.

1. $\begin{cases} y = -3x + 13 \\ y = -2x + 1 \end{cases}$

2. $\begin{cases} y = x + 1 \\ y = -x + 5 \end{cases}$

10. Describe a sequence of transformations that maps polygon $ABCD$ onto polygon $A'B'C'D'$.

Reflection

1. Put a smiley face next to a problem you were stuck on and then figured out.
2. Use this space to ask a question or share something you're proud of.

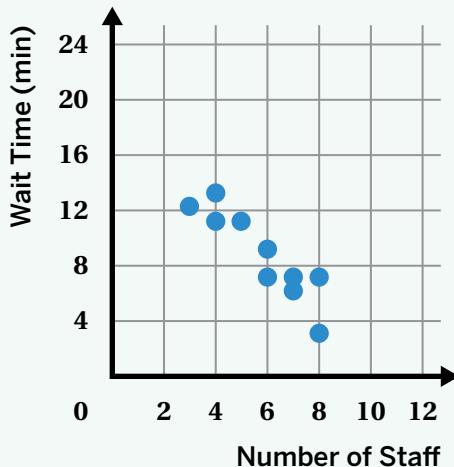

Lesson Summary

You can use a scatter plot to help identify patterns in data points and relationships between two variables.

For example, this scatter plot shows data about how long customers waited at a drive-thru restaurant and the number of staff working at that time.

The scatter plot shows both specific information and general trends, including:

- When 3 staff were working, the wait time was about 12 minutes.
- The more staff there are, the shorter the wait time seems to be.

Things to Remember:

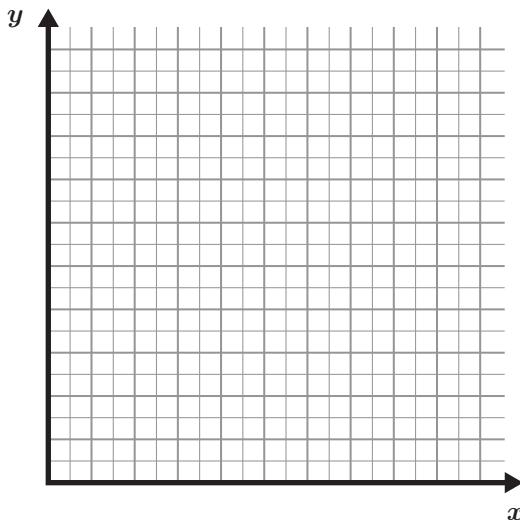

Lesson Practice

8.6.05

Name: Date: Period:

Problems 1–2: Use the table.

1. Create a scale for the graph so it fits all the data.
Then create a scatter plot of the data.

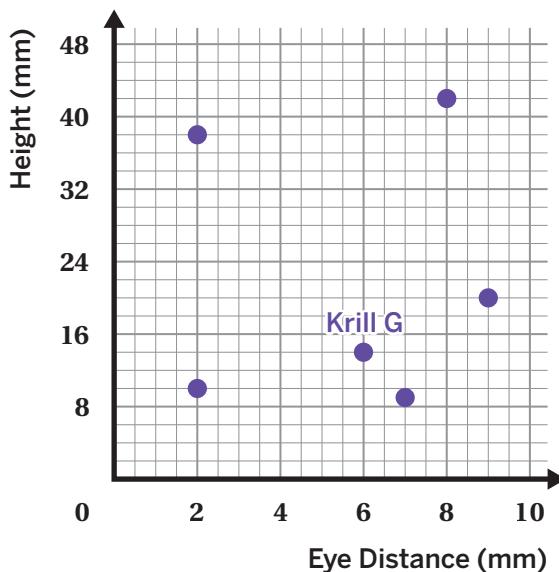

x	y
2	3
5	5
4	2
8	3
6	3
3	5
1	6
4	4

2. When do you think it is better to use a table to represent data?
When do you think it is better to use a scatter plot?

Problems 3–5: The table and scatter plot show the heights and eye distances of seven different krill (small shrimp-like crustaceans).

Krill	Eye Distance (mm)	Height (mm)
A	7	9
B	2	38
C	2	10
D	8	42
E	7	22
F	9	20
G		

3. On the scatter plot, circle the point that represents the tallest krill.

Lesson Practice

8.6.05

Name: Date: Period:

4. On the scatter plot, plot a point that represents Krill E.

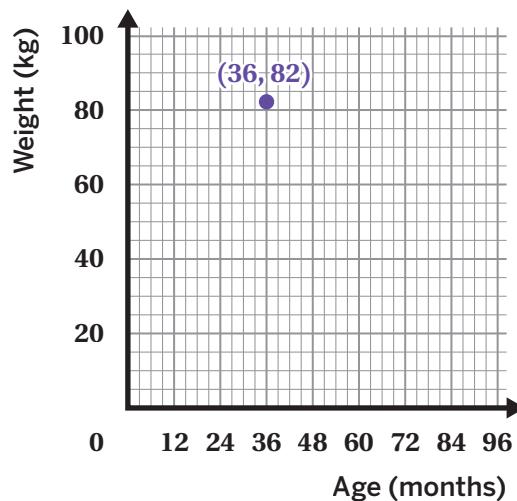

5. Complete the table with the values that represent Krill G.

Problems 6–7: The graph shows the age and weight of a giant panda.

6. What does the point tell you about the panda?

7. Plot a point to represent a different giant panda that is 24 months old and weighs 50 kilograms.

Spiral Review

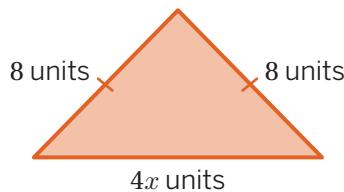

Problems 8–9: Solve each equation. Show your thinking.

8. $2(3 - 2c) = 30$

9. $3x - 2 = 7 - 6x$

10. The perimeter of the triangle is $10x$ units. Which equation represents the perimeter of the triangle?

- A. $10x = 8 + 12x$
B. $10x = 4 + 16x$
C. $10x = 12 + 8x$
D. $10x = 16 + 4x$

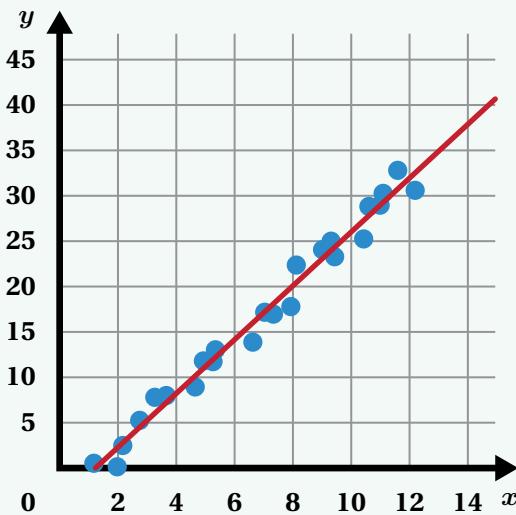

Reflection

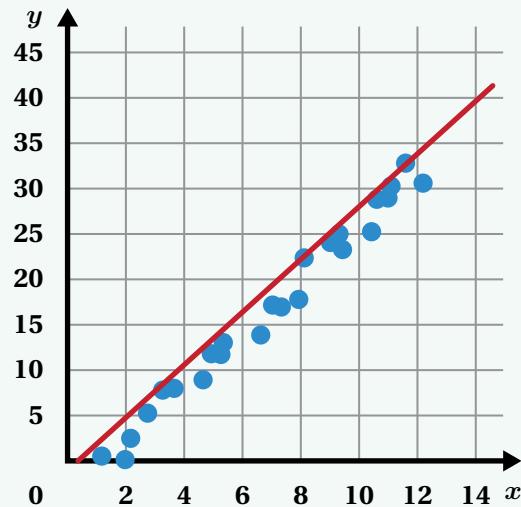

- Put a smiley face next to the problem that you learned from most.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

When creating a line of fit for a scatter plot, it's important to determine how well the line fits the data. A good line of fit follows the trend of the data, is as close to the plotted points as possible, and has about the same number of points above and below the line. The line may pass through some, all, or none of the points.

This line is a good fit for the data.

This line is not a good fit for the data.

Things to Remember:

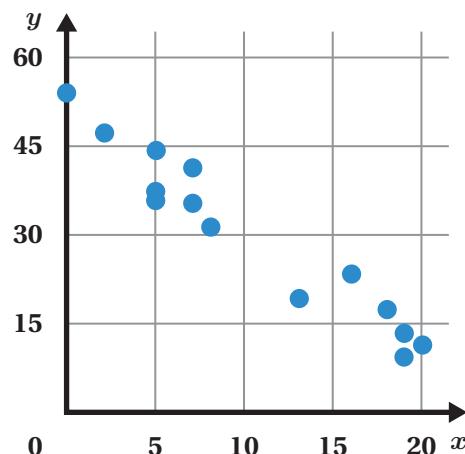

Lesson Practice

8.6.06

Name: Date: Period:

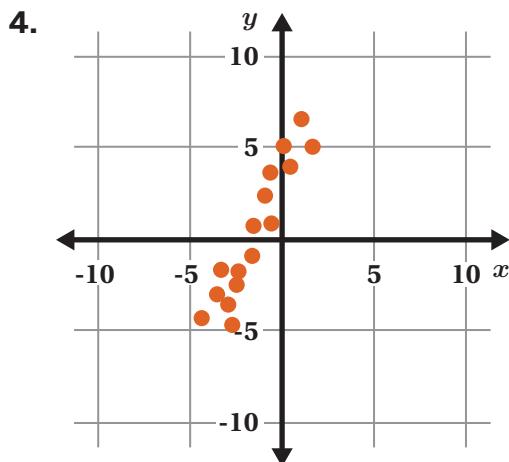

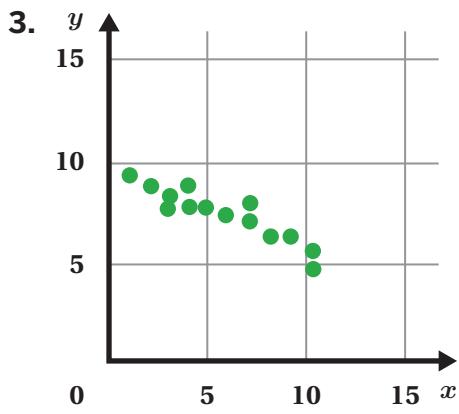

Problems 1–2: Use this scatter plot.

- Sketch a line of fit for the data.

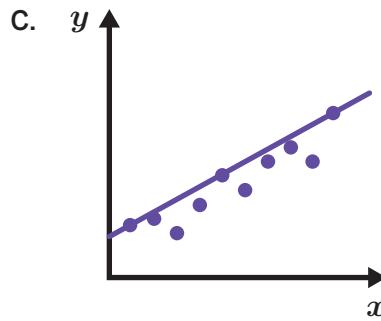

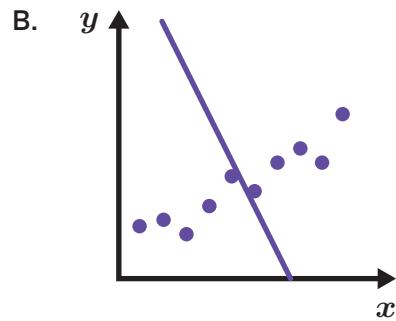

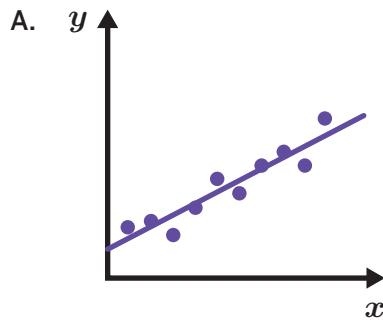

- If a new data point has an x -value of 10, what does your line of fit predict for the value of y ?

Problems 3–4: Sketch a line that fits the data.

- Which line best fits the data? Explain your thinking.

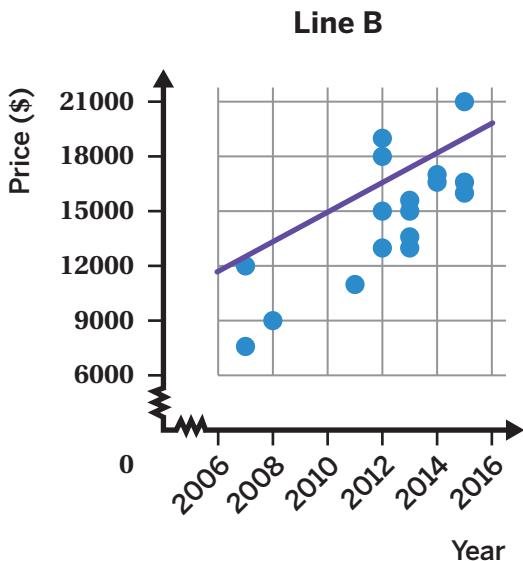

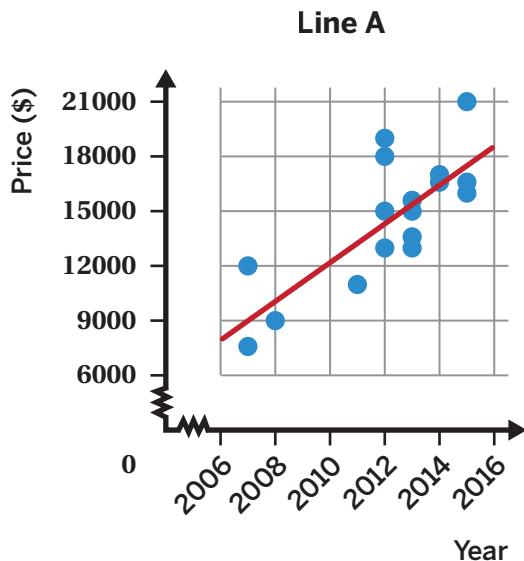

Lesson Practice

8.6.06

Name: Date: Period:

6. Each line of fit applies to the same data.

Which line is a better fit for the data?

Explain your thinking.

Spiral Review

7. Match each equation with the scenario it represents.

Equation

Scenario

a. $y = 3x$

A dump truck is hauling loads of dirt to a construction site. After 20 loads, there are 70 cubic feet of dirt.

b. $\frac{1}{2}x = y$

You are making a water and salt mixture that has 2 cups of salt for every 6 cups of water.

c. $y = 3.5x$

10 blueberries weigh 4 grams.

d. $y = \frac{2}{5}x$

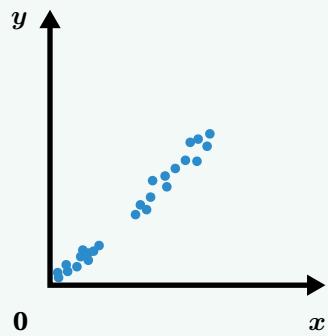

For every 48 cookies I bake, my students receive 24 cookies.

Reflection

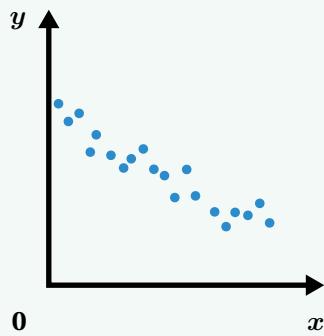

- Put a star next to a problem you could explain to a classmate.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

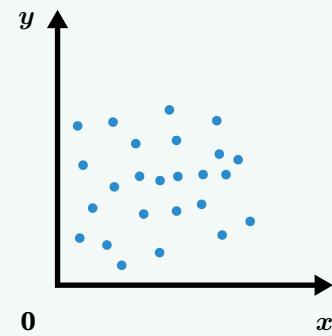

If two variables on a scatter plot are related, there is an **association**. The slope of a linear model can help determine the type of association. A positive association means that when one variable increases, the other also increases. A negative association means that when one variable increases, the other decreases. If the scatter plot shows no clear trend between the two variables, then the variables have no association.

Positive association

Negative association

No association

Things to Remember:

Lesson Practice

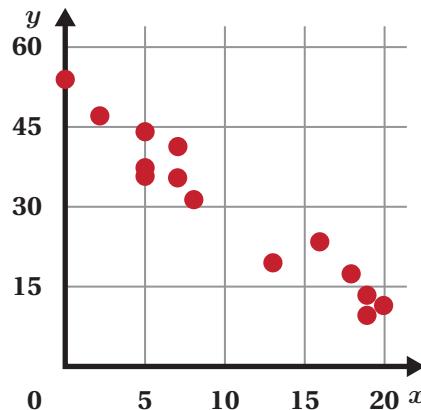

8.6.07

Name: Date: Period:

1. Which type of association does the scatter plot show?

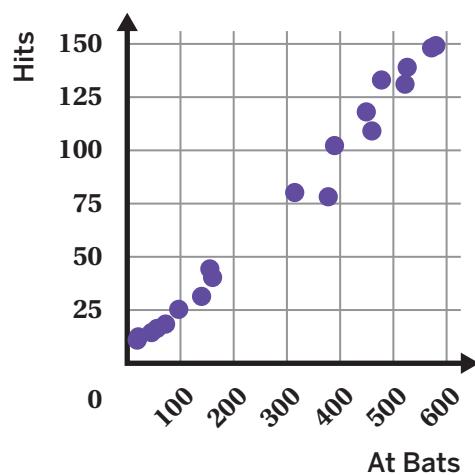

- A. Positive association
- B. Negative association
- C. No association

Explain your thinking.

2. The scatter plot shows the number of hits and at bats for players on a baseball team. Which conclusion is best supported by the scatterplot?

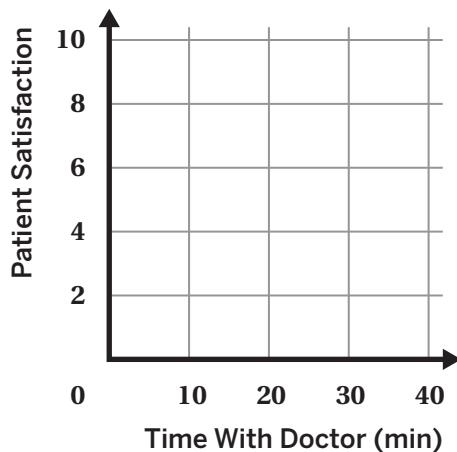

- A. As the number of at bats increases, the number of hits also increases.
- B. As the number of at bats increases, the number of hits decreases.
- C. As the number of hits increases, the number of at bats remains the same.
- D. There is no relationship between the number of at bats and the number of hits.

Problems 3–4: The doctors in a medical clinic looked at the relationship between patient satisfaction on a 0–10 scale and the number of minutes spent with a doctor. They found the variables had a positive association.

3. What does this positive association mean about the relationship between patient satisfaction and time with a doctor?

4. Create a scatter plot that represents this situation.

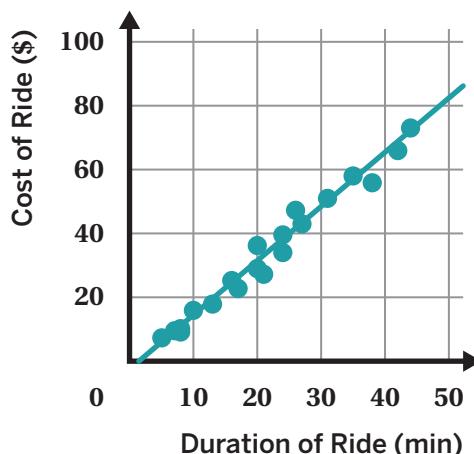

Lesson Practice

8.6.07

Name: Date: Period:

Problems 5–7: The scatter plot shows the data from 20 taxi rides in Austin, Texas, along with a linear model whose equation is $y = 1.7x - 2.5$.

5. What is the slope of the linear model?
6. What does the slope represent in this situation?

7. What type of association is there between duration and cost of a taxi ride?

Positive association Negative association

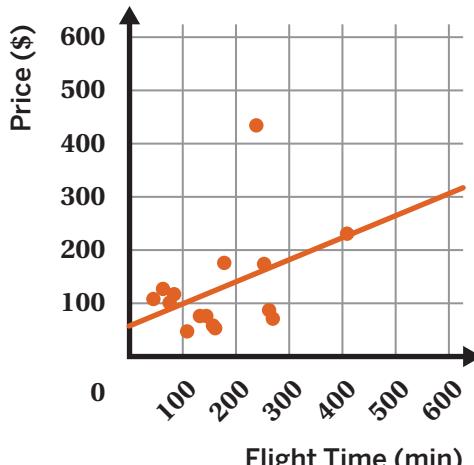

No association

Explain your thinking.

Spiral Review

Problems 8–9: The scatter plot shows the flight time and price for several different flights from O'Hare Airport in Chicago.

8. Circle any data point(s) that appear to be outliers.
9. Use the linear model to estimate the price of a 10-hour flight from O'Hare Airport.
10. The equation $y = 5280x$ gives the number of feet, y , in x miles. What does the number 5,280 represent in this relationship?
11. Solve this system of equations. Write your answer as an ordered pair (x, y) .
$$y = -5x + 2$$
$$y = -4x - 3$$

11. Solve this system of equations. Write your answer as an ordered pair (x, y) .

$$y = -5x + 2$$

$$y = -4x - 3$$

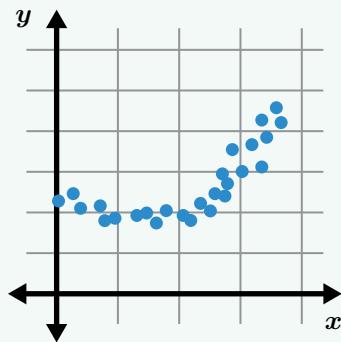

Reflection

1. Put a heart next to the problem you feel most confident about.
2. Use this space to ask a question or share something you're proud of.

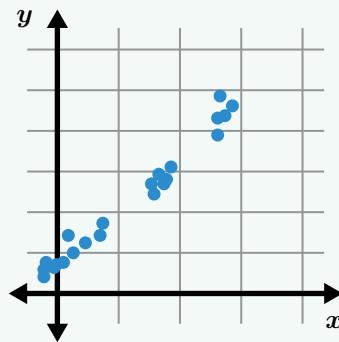

Lesson Summary

When you can model data on a scatter plot with a straight line, we say it has a linear association. Data that can't be modeled by a straight line has a non-linear association. Sometimes groups of data points appear close together, which are called **clusters**.

This scatter plot is an example of a non-linear association, without clusters.

This scatter plot is an example of a linear association, with clusters.

**Things to Remember:**

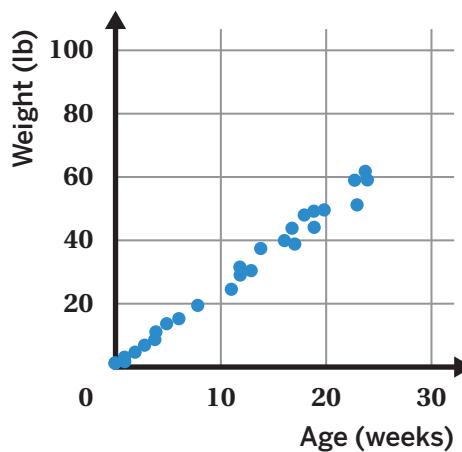

Lesson Practice

8.6.08

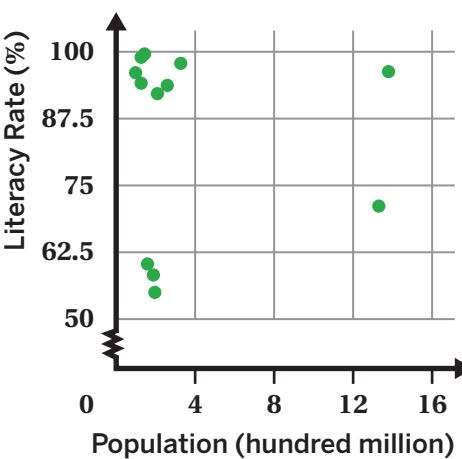

Name: Date: Period:

1. The graph shows the age and weight of babies in a nursery. Select *all* the terms that describe the association on the scatter plot.

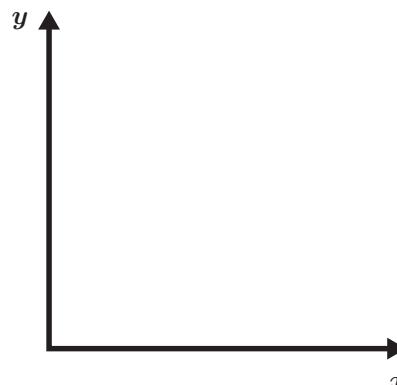

- A. Linear association
- B. Non-linear association
- C. Positive association
- D. Negative association
- E. No association

2. The scatter plot shows the literacy rate and population for 12 countries. Decide whether there are clusters in the scatter plot. Explain your thinking.

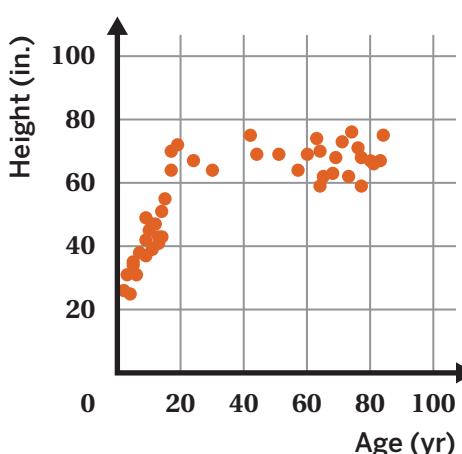

3. Create a scatter plot that has a positive linear association, with clusters.

Problems 4–5: A doctor in a small town sees patients of all ages. Use the scatter plot of her patient's ages and heights to decide if each statement is true or false.

4. There is a non-linear association between the ages and heights of the doctor's patients.
5. As patients' ages increase, their heights tend to decrease.

Lesson Practice

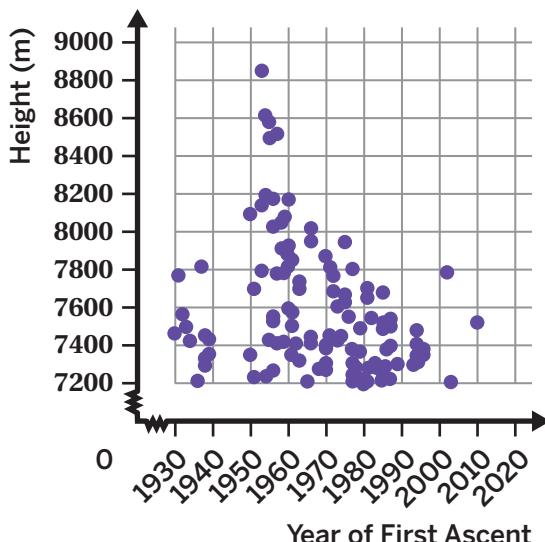

8.6.08

Name: Date: Period:

Spiral Review

6. The scatter plot shows data for some of the tallest mountains on Earth. Which of the following terms best describes the association between the heights of the mountains and years of first recorded ascent?

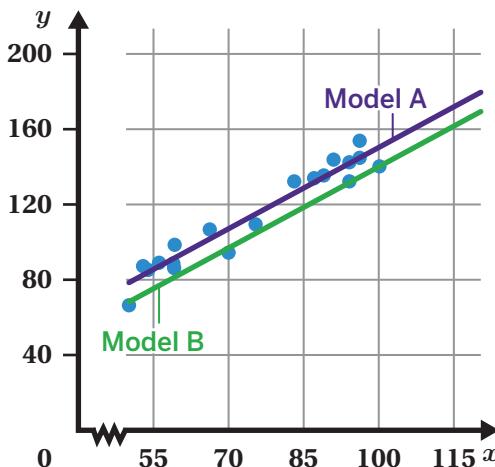

- A. Linear association
- B. Positive association
- C. Negative association
- D. No association

7. Here are two different linear models for the same data. Which model is a better fit for the data? Explain your thinking.

8. The points $(2, 4)$ and $(6, 7)$ fall on a line. What is the slope of the line?

- A. 1
- B. 2
- C. $\frac{4}{3}$
- D. $\frac{3}{4}$

Problems 9–10: A cone has a volume of V cubic units.

9. Another cone has the same height and $\frac{1}{3}$ of the radius of the original cone. Write an expression for its volume.

10. Another cone has the same height and 3 times the radius of the original cone. Write an expression for its volume.

Reflection

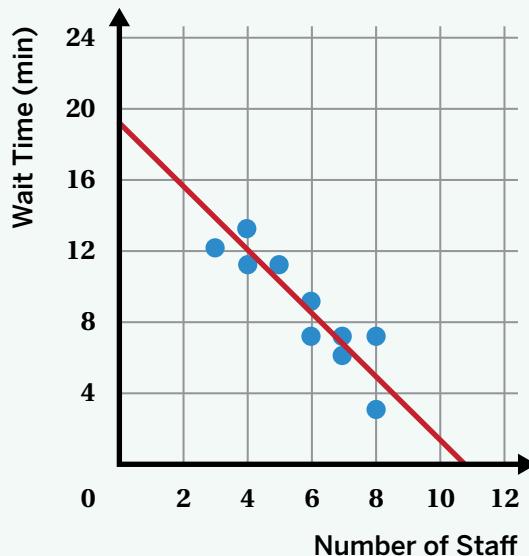

1. Put a question mark next to a problem you were feeling stuck on.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

By understanding the association between two variables, you can make predictions about unknown values. When there's a linear association, using a linear model can often make predictions more accurate.

For example, this scatter plot shows data about how many minutes customers waited at a drive-through restaurant and the number of staff working at that time. This data can be modeled by the equation $y = -1.75x + 19$.

- The slope of the linear model is -1.75 , which means that if the number of staff increases by 1 person, the wait time decreases by 1.75 minutes.
- The linear model predicts that if there are 2 staff working, the wait time will be approximately 15.5 minutes.
- But the linear model also predicts that when there are 0 staff working, the wait time will be 19 minutes, which is impossible!

**Things to Remember:**

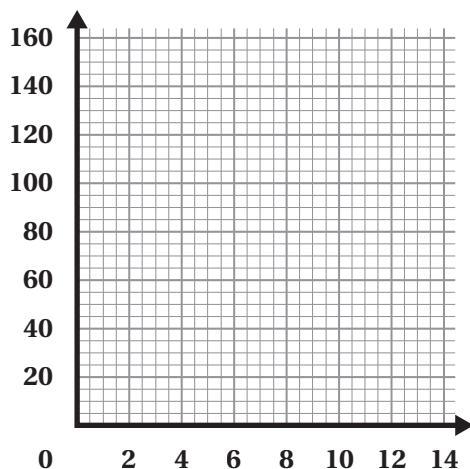

Lesson Practice

8.6.09

Name: Date: Period:

Problems 1–5: Stores across the country sell a particular book at different prices. The table shows the price of the book and the number of books sold at that price.

1. Create a scatter plot for this data. Include labels for the horizontal and vertical axes.

Price (\$)	Number of Books Sold
10.50	60
12.10	30
8.45	81
9.25	70
9.75	80
7.25	120
12	37
9.99	130
7.99	100

2. Are there any outliers? Explain your thinking.
3. What type of association does there appear to be between the price of the book and the number of books sold? Explain your thinking.
4. Draw a line on the graph that you think is a good fit for the data.
5. A bookstore plans to sell the book for \$6. Use your line to predict the number of books the store will sell. Explain your thinking.

Lesson Practice

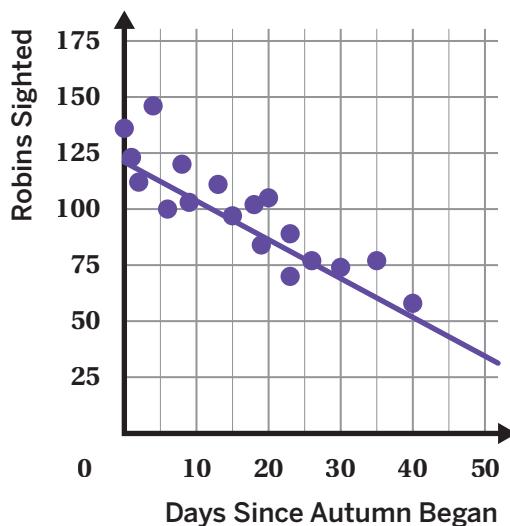

8.6.09

Name: Date: Period:

Problems 6–7: This scatter plot shows data about the number of robins sighted at a local park and the number of days since autumn began.

6. Approximately how many robins were sighted 15 days since autumn began?

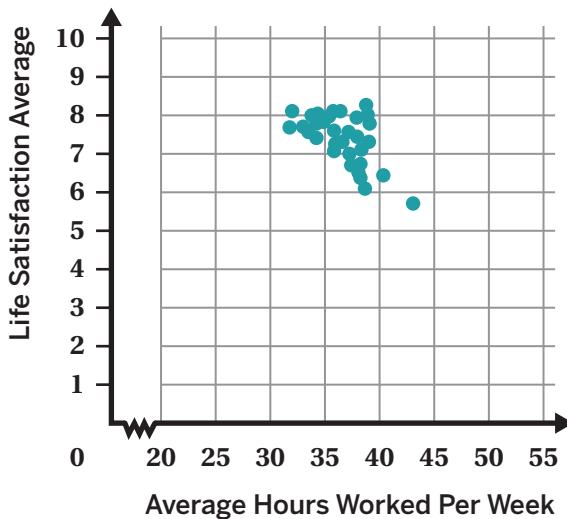

7. Use the line of fit to make a prediction for how many robins will be sighted 50 days since autumn began. Explain your thinking.

Spiral Review

Problems 8–9: Martina is interested in the quality of life in different countries. Martina created this scatter plot to show the average number of hours people worked in a week and their average life satisfaction (on a 0–10 scale). Each point on the graph represents a different country.

8. Circle the point that represents the country where average life satisfaction is lowest. How many hours are in the average work week in that country?
9. Select all the true statements about the data in the scatter plot.
- A. The variables have a positive association.
 - B. The variables have a negative association.
 - C. A linear model that fits the data would have a positive slope.
 - D. A linear model that fits the data would have a negative slope.
 - E. More than half of the countries have an average life satisfaction above 7.

Reflection

1. Circle the question you think will help you most on the End-of-Unit Assessment.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

A **two-way table** lets us compare two variables of *categorical data*, which is data that can be sorted into categories.

This two-way table shows data about whether students meditated on a certain day, and whether they felt calm or agitated that day. Each entry in the table represents the **frequency**, or the number of times, that a category appears in the data set.

	Meditated	Did Not Meditate	Total
Calm	45	8	53
Agitated	23	21	44
Total	68	29	97

For example, 45 students who meditated were calm, and 23 students who meditated were agitated.

You can use these two-way tables to investigate possible connections between variables. In the example, we can see there's a connection between meditating and feeling calm, since a majority of the people who felt calm also meditated.

Things to Remember:

Lesson Practice

8.6.10

Name: Date: Period:

Problems 1–3: The table shows the results of a survey about TV watching habits.

1. What do you notice?

	Watches TV Daily	Does Not Watch TV Daily	Total
Younger Than 18	30	80	110
18 or Older	60	35	95
Total	?	115	205

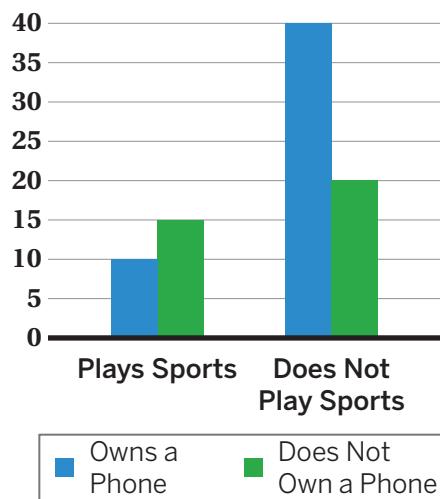

2. What do you wonder?

3. In total, how many people responded that they watch TV daily?

Problems 4–5: The bar graph shows data for a group of 8th grade students.

4. Complete the two-way table based on the information in the bar graph.

	Owns a Phone	Does Not Own a Phone	Total
Plays Sports			
Does Not Play Sports			
Total			

5. Select *all* of the true statements.

- A. More students do not play sports than do.
- B. More students own a phone than don't.
- C. There are only 10 students who own a phone but don't play sports.
- D. There are no students who own a phone and play sports.
- E. There are 35 total students that own a phone.

6. Use the information in the two-way table to write two *true* statements about the data.

	Likes Riding a Bicycle	Does Not Like Riding a Bicycle
Kids	30	10
Adults	40	60

Lesson Practice

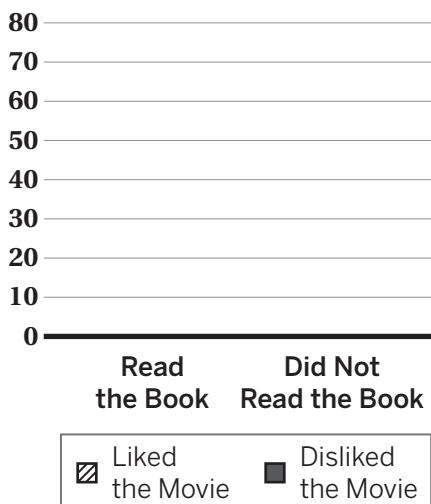

8.6.10

Name: Date: Period:

Problems 7–8: 180 people were surveyed about a movie they watched that was based on a book. Some people had already read the book and some had not.

7. Create a bar graph based on the information in the table.

	Liked the Movie	Disliked the Movie	Total
Read the Book	65	15	80
Did Not Read the Book	50	50	100
Total	115	65	180

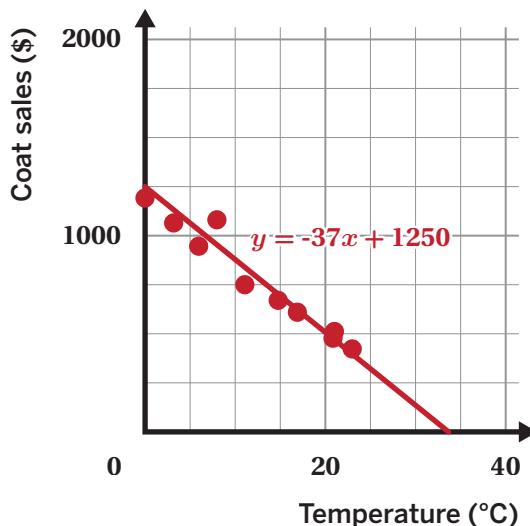

8. What claim might a person make based on this data?

Spiral Review

Problems 9–11: The scatter plot shows a store's daily coat sales and the outside temperature that day. The equation for the line of fit is $y = -37x + 1250$.

9. What is the slope and y -intercept of the line of fit?
10. What does the slope tell you about this situation?
11. What does the y -intercept tell you about this situation?

Reflection

- Circle the problem that was the most challenging for you.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

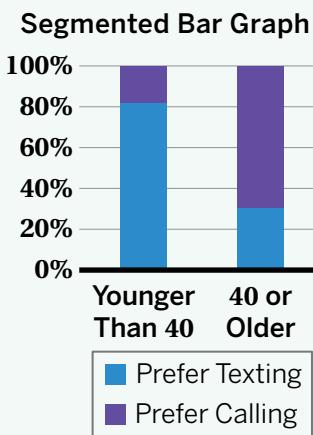

You can use specific types of two-way tables and bar graphs to show frequencies and percentages within data sets.

The **relative frequency** of a category is the fraction or percentage of the data set that's in that category. A two-way table of relative frequencies shows the fraction or percentage of each category instead of the number of data points.

A **segmented bar graph** compares different categories within a data set. Each bar represents all the data within one category, or 100%. The bars are each separated into parts, or segments, that show what percentage each part makes up of the whole category.

We can use representations like these to identify associations between two categorical variables. For example, the table and graph show an association between categorical variables, age, and communication preference.

Relative Frequencies			
	Prefer Texting	Prefer Calling	Total
Younger Than 40	82%	18%	100%
40 or Older	33%	67%	100%

**Things to Remember:**

Problems 1–4: A farmer brings produce to the farmer's market and records whether people bought lettuce, apples, both, or neither.

- How many people bought lettuce?

	Bought Apples	Did Not Buy Apples	Total
Bought Lettuce	14	58	72
Did Not Buy Lettuce	8	29	37
Total	22	87	109

- How many people bought lettuce *and* apples?

- Complete the table to show the relative frequencies for each row.

	Bought Apples	Did Not Buy Apples	Total
Bought Lettuce			
Did Not Buy Lettuce			

- Based on the data, is there an association between buying lettuce and buying apples? Explain your thinking.

Problems 5–7: Researchers want to study news-reading habits among different age groups. They asked whether people primarily read news articles in print or on the internet.

	Internet Articles	Print Articles
18–25 Years Old	151	28
26–45 Years Old	132	72
46–65 Years Old	48	165

- Calculate the relative frequencies for each age group.

	Internet Articles	Print Articles	Total
18–25 Years Old			
26–45 Years Old			
46–65 Years Old			

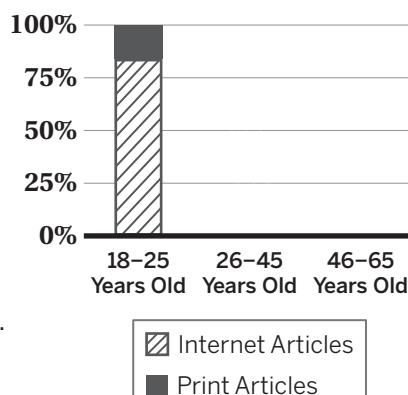

Lesson Practice

8.6.11

Name: Date: Period:

6. Complete the segmented bar graph by drawing the missing bars. Create one segmented bar for each row of the table.

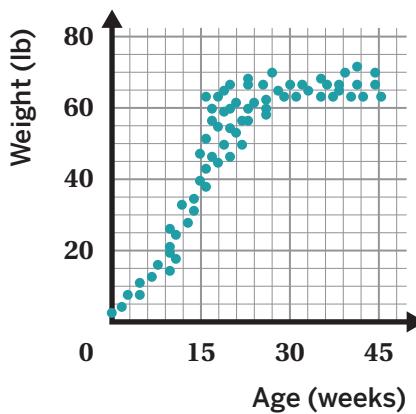

7. Is there an association between age groups and the method they use to read articles? Explain your thinking.

Spiral Review

8. Select *all* the phrases that describe the association on this scatter plot showing the age and weight of a group of male huskies.

- A. Linear association
- B. Negative association
- C. Non-linear association
- D. No association
- E. Positive association

9. In a class of 25 students, some students play a sport, some play a musical instrument, some do both, and some do neither. Complete the table.

	Plays an Instrument	Does Not Play an Instrument	Total
Plays a Sport		11	
Does Not Play a Sport	9		13
Total	10		25

Reflection

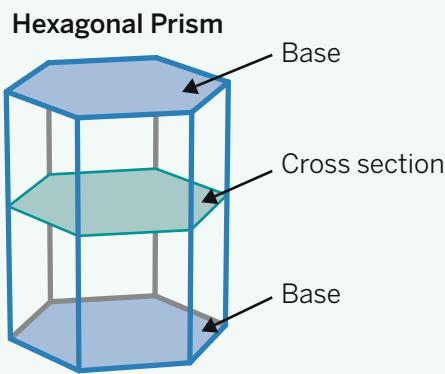

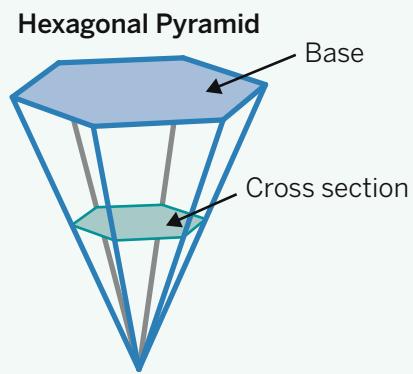

1. Circle a problem you're still curious about.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

A **cross section** is the shape you see when you cut through a three-dimensional figure.

For example, if you cut a hexagonal *prism* parallel to the base, the cross section is a hexagon that is the same size as the base. If you make a vertical cut instead, the cross section is a rectangle that is as tall as the prism.

If you cut a hexagonal *pyramid* parallel to the base, the cross section is a hexagon that is smaller than the base. If you make a vertical cut instead, the cross section is a triangle that is taller than it is wide.

Prism**Pyramid****Things to Remember:**

Lesson Practice

7.7.09

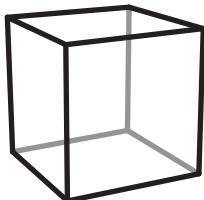

Name: Date: Period:

Problems 1–3: Show how to cut a cube to make each cross section.

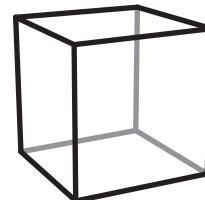

1. Square

2. Triangle

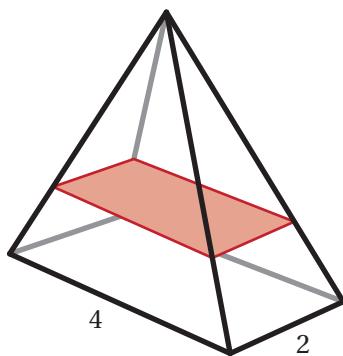

3. Rectangle

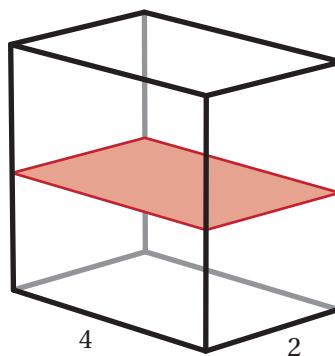

Problems 4–5: Determine how each cross section will change.

4. Here is a pyramid that has been cut parallel to its base. What will happen to the area of the cross section as the cut moves closer to the base?

5. Here is a rectangular prism that has been cut parallel to its base. What will happen to the area of the cross section as the cut moves closer to the base?

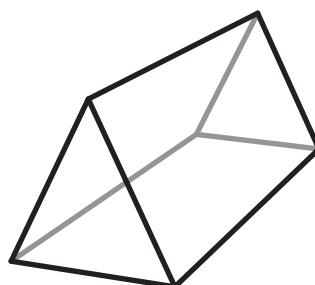

- A. Increase
B. Decrease
C. Stay the same
- A. Increase
B. Decrease
C. Stay the same
6. Cuts are made through a cube and a right square pyramid. One cut is vertical and one cut is horizontal. Select *all* the statements that are true about the two-dimensional cross sections that could result from one of these cuts.
- A. A triangle could result from one of these slices through the cube.
 B. A square could result from one of these slices through the cube.
 C. A rectangle, but not a square, could result from one of these slices through the cube.
 D. A triangle could result from one of these slices through the pyramid.
 E. A square could result from one of these slices through the pyramid.

Lesson Practice

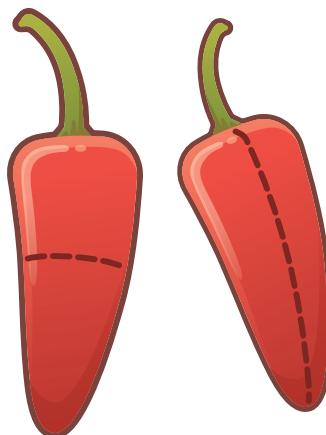

7.7.09

Name: Date: Period:

7. Kris says: *No matter which way you cut this triangular prism, the cross section will be a triangle.* Sid says: *I'm not so sure.* Describe or show a cut that Sid might be thinking of.

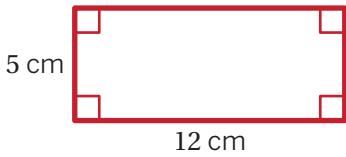

8. Here are two peppers. One is cut horizontally, and the other is cut vertically, producing different cross sections. Sketch the two cross sections.

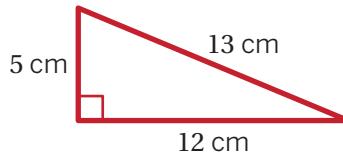

Spiral Review

Problems 9–11: Determine the area of each shape.

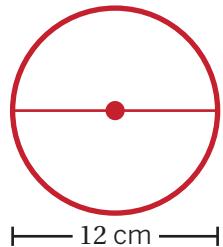

9.

10.

11.

12. Select all the expressions that are equivalent to $3x - 4 + 2x - 6$.

A. $x - 2$

B. $5x - 2$

C. $5(x - 2)$

D. $5x + 10$

E. $5x - 10$

Reflection

- Star a problem you are still feeling confused about.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

Any cross section of a prism that is parallel to the base will be identical to the base. This means you can slice a prism into layers to help you calculate its *volume*.

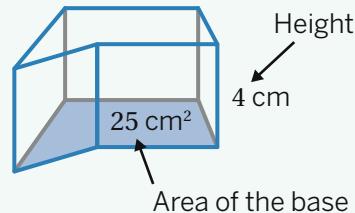

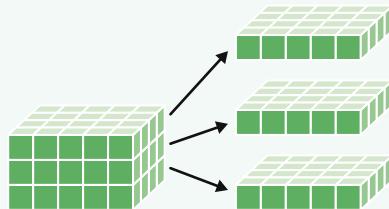

For example, if you have a rectangular prism that is 3 units tall and has a base that is 4 units by 5 units, you can imagine the prism as 3 layers of $4 \cdot 5$ cubic units.

That means the volume of this rectangular prism is $(4 \cdot 5) \cdot 3$ cubic units.

In general, you can calculate the volume of any prism by multiplying the area of its base by its height.

In other words, the volume of a prism is $V = B \cdot h$, where h is its height and B is the area of its base.

For example, this prism has a volume of 100 cubic centimeters because $25 \cdot 4 = 100$.

**Things to Remember:**

8. Fill in the table using the numbers 1 to 9 only once to create two prisms with the same volume.

	Prism 1 (units)	Prism 2 (units)
Length, ℓ		
Width, w		
Height, h		

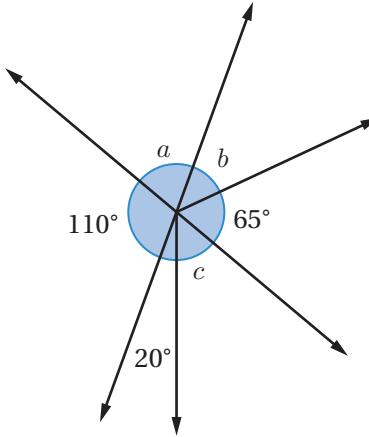

Spiral Review

9. Select all the expressions that are equivalent to $3(x - 2) + 5$.

A. $3x + 3$ B. $3(x - 1)$ C. $3x - 1$ D. $-1 + 3x$ E. $1 - 3x$

10. Mayra buys a \$25 hat. The sales tax is 6.25%. How much will Mayra spend in total, including the tax?

11. Here is a diagram. Determine the values of a , b , and c .

Reflection

- Circle the problem you're most interested in knowing more about.
- Use this space to ask a question or share something you're proud of.

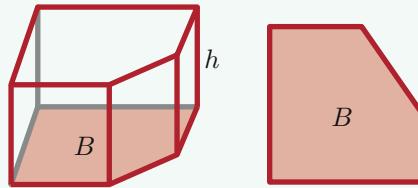

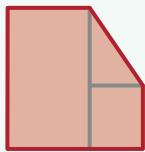

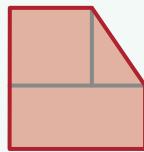

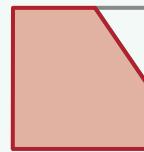

Lesson Summary

To calculate the volume of a prism, you can multiply the area of the base, B , by the height, h .

Sometimes the shape of a prism's base is a more complex *polygon*.

There are many strategies for calculating the area of a complex shape, including breaking it into rectangles and triangles, or surrounding the shape in a rectangle and subtracting the missing piece.

Here are three first steps you might take in calculating the area of this prism's base:

**Example 1****Example 2****Example 3****Things to Remember:**

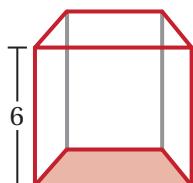

Lesson Practice

7.7.11

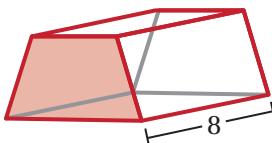

Name: Date: Period:

Problems 1–2: The volume of each prism is 24 cubic units. What is the area of each prism's base?

1.

2.

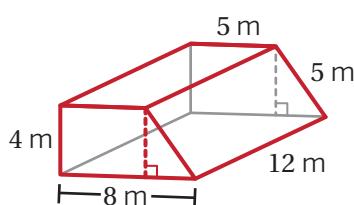

Area of the base:

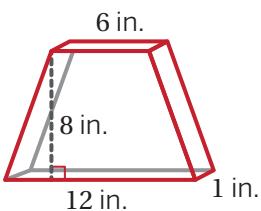

Area of the base:

Problems 3–5: Determine the volume of each prism. Show or explain your thinking.

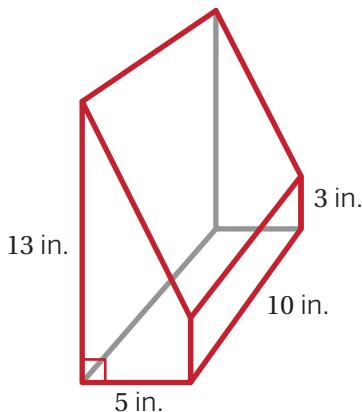

3.

4.

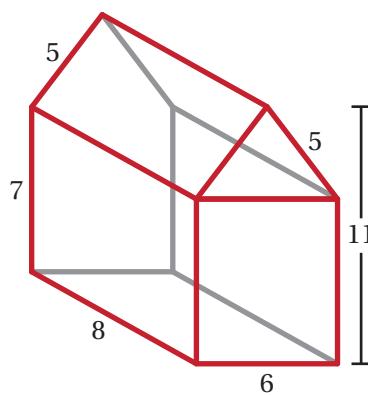

5.

6. We can create a house-shaped prism by attaching a triangular prism on top of a rectangular prism. Select *all* the true statements about the house-shaped prism.

- A. The shape of the base is a triangle.
- B. The shape of the base is a pentagon.
- C. The area of the base is 54 square units.
- D. The area of the base is 42 square units.
- E. The volume of the prism is 432 cubic units.

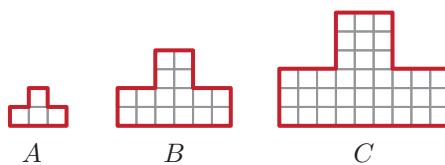

Lesson Practice

7.7.11

Name: Date: Period:

7. Here are the bases of three different prisms.
They all have the same volume. How tall could each prism be? Explain your thinking.

Spiral Review

Problems 8–11: Write each fraction as a decimal.

8. $\frac{1}{2}$

9. $\frac{1}{4}$

10. $\frac{3}{4}$

11. $\frac{1}{5}$

Problems 12–13: Two different triangles each have one side that is 5 centimeters long and one side that is 3 centimeters long.

12. Sketch two non-identical triangles with these measurements.

Triangle A

Triangle B

13. Explain how you can tell that your two triangles are not identical.

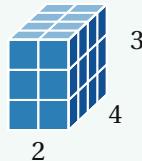

Reflection

1. Star the problem you spent the most time on.
2. Use this space to ask a question or share something you're proud of.

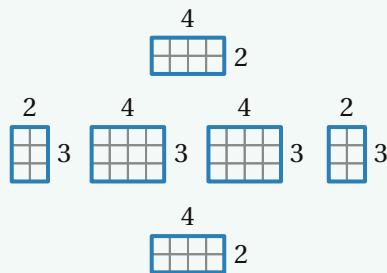

Lesson Summary

The *surface area* of a three-dimensional shape is the number of square units that cover all the faces of the polyhedron, without any gaps or overlaps.

Here are two strategies for calculating the surface area of a rectangular prism.

**Strategy 1**

Calculate the area of each face separately and then add all of the areas.

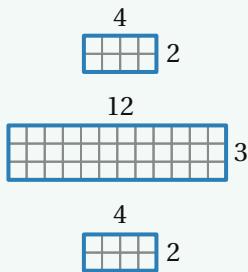

$$8 + 6 + 12 + 12 + 6 + 8 = 52$$

Surface area: 52 square units

Strategy 2

Break the prism into its two identical bases and unfold the sides into one long rectangle. Add the three areas.

$$8 + 36 + 8 = 52$$

Surface area: 52 square units

Using either strategy to calculate the surface area or using equivalent calculations will result in the same total surface area.

Things to Remember:

Lesson Practice

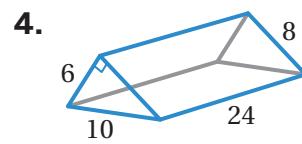

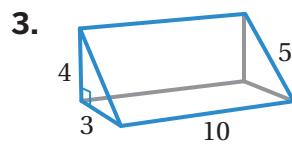

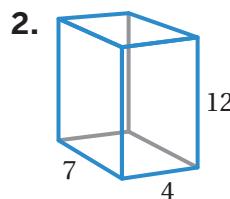

7.7.12

Name: Date: Period:

1. Select *all* the situations where knowing the surface area of an object would be useful.

- A. The amount of paint needed to paint a room.
- B. The amount of water needed to fill an aquarium.
- C. How much wrapping paper a gift will need.
- D. How many watermelons fit in a box for shipping.
- E. The amount of gasoline left in the tank of a vehicle.

Problems 2–4: Determine the volume and surface area of each prism.

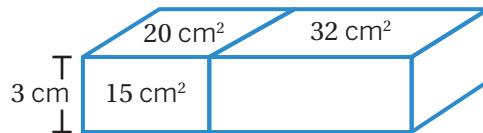

Volume (cubic units)	
Surface Area (square units)	

5. Determine the surface area and volume of this shape.

Show or explain your thinking.

Surface area:

Volume:

Lesson Practice

Problems 6–9: Write each fraction as a percentage.

6. $\frac{1}{4}$

7. $\frac{1}{5}$

8. $\frac{3}{5}$

9. $\frac{3}{10}$

Problems 10–11: In a 4-by-6 foot Colorado state flag, the gold-colored circle has a 1-foot radius.

10. How much gold fabric is needed to create the flag?

Public Domain

11. What percent of the flag is gold?

12. Draw one or more diagrams that show complementary and supplementary angles.

Reflection

1. Put a heart next to the problem you're most proud of.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

Knowing when to calculate volume and surface area can be helpful in answering questions about situations in context.

Questions related to volume:

- How much water can a container hold?
- How much material did it take to build a solid object?

Questions related to surface area:

- How much fabric is needed to cover a surface?
- How much of an object needs to be painted?

One way to decide if a question is asking about volume or surface area is to think about the units of measure. Volume is measured in cubic units and surface area is measured in square units.

Things to Remember:

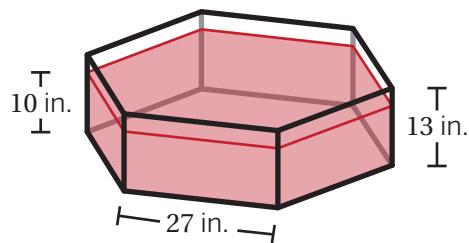

Lesson Practice

7.7.13

Name: Date: Period:

Problems 1–3: Here is a new sandbox Polina is designing for her local playground.

1. Polina knows she needs 18,940 cubic inches of sand to fill the sandbox up 10 inches. What is the area of the sandbox's base?

2. If Polina wanted to fill the sandbox up 3 more inches to the top, how much more sand would she need?
3. Polina wants to paint the entire outside of the sandbox (not including the bottom). How many square inches will she need to cover with paint? Explain your thinking.
4. There are two boxes of cereal in the shape of rectangular prisms. The first box has a height of 10 inches, a length of 8 inches, and a width of 3.5 inches. The second box has a height of 10 inches, a length of 7.5 inches, and a width of 2.5 inches. What is the difference in volume, in cubic inches, between the two boxes of cereal?

A. 467.5

B. 92.5

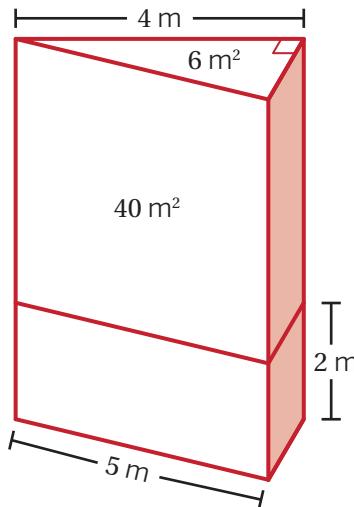

C. 280

D. 375

Problems 5–6: Here is a pair of stacked triangular prisms with bases of the same size.

5. Determine the surface area of this shape.

6. Determine the volume of this shape.

Name: Date: Period:

Spiral Review

Problems 7–10: Write each decimal or percentage as a fraction.

7. 0.25

8. 40%

9. 1%

10. 0.8

Problems 11–13: A customer buys a winter jacket at a used clothing store that costs \$30. The sales tax is 6% where they live.

11. How much does the customer pay in total?

12. Write an equation that represents the total cost (including sales tax), c , of any item bought in this store with price p .

13. The customer buys a backpack at a different store. It is on sale for 30% off. The customer pays \$33.39 total (including sales tax). What was the original price of the backpack?

Reflection

1. Circle the problem you think will help you most on the End-of-Unit Assessment.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

Expressions with *exponents* are useful for representing repeated multiplication. In the expression 3^5 , 5 is the exponent. When the exponent is a positive integer, it says how many times the number or expression is multiplied.

For example, $3^5 = \underbrace{3 \cdot 3 \cdot 3 \cdot 3 \cdot 3}_{\text{5 times}}$. Imagine writing 3^{100} using multiplication!

Here are a few more examples:

- $7 \cdot 7 \cdot 7 \cdot 7 \cdot 7 = 7^5$
- $5 \cdot 8 \cdot 5 \cdot 8 \cdot 5 \cdot 8 \cdot 5 = 5^4 \cdot 8^3$
- $10 \cdot 10 \cdot 10 + 10 \cdot 10 = 10^3 + 10^2$

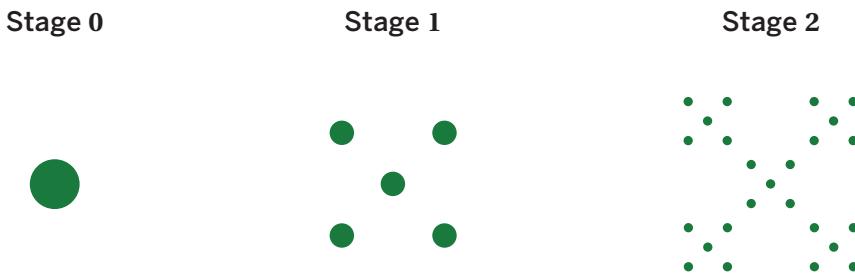

Things to Remember:

Lesson Practice

8.7.01

Name: Date: Period:

1. Here are three stages of a pattern of circles.

How many circles will there be in Stage 4?

2. Complete the table.

Expanded Expression	Exponent Expression	Value
$3 \cdot 3 \cdot 3 \cdot 3$		
$7 \cdot 7 \cdot 7 \cdot 7 \cdot 7$		
	2^5	
	4^3	

Problems 3–4: Write an equivalent expression that uses exponents.

3. $2 \cdot 9 \cdot 2 \cdot 9 \cdot 2 \cdot 2$

4. $7 \cdot 7 \cdot 7 + 7 \cdot 7 \cdot 7 \cdot 7$

5. Each day, the number of grains of rice you have triples. On Day 1, you have 3 grains of rice. On Day 2, you have 9 grains of rice. On what day will you have 243 grains of rice?

Show or explain your thinking.

6. Adnan starts with two coins on Day 1. The number of coins doubles every day. How many coins will Adnan have on Day 8? Write your answer as an expression with an exponent.

Lesson Practice

8.7.01

Name: Date: Period:

Spiral Review

7. Which expression is equivalent to $10000 + 225$?

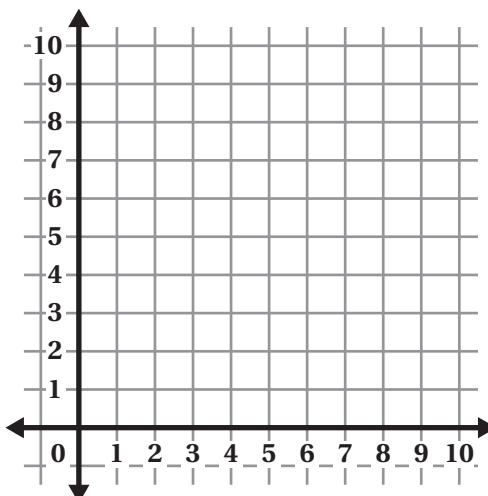

A. $10^3 + 9 \cdot 25$ B. $10^4 + 15^2$ C. $100^3 + 9 \cdot 25$ D. $1000^2 + 15^2$

8. The points $(2, 4)$ and $(6, 7)$ lie on a line.

What is the slope of the line?

Sketch on the grid if it helps with your thinking.

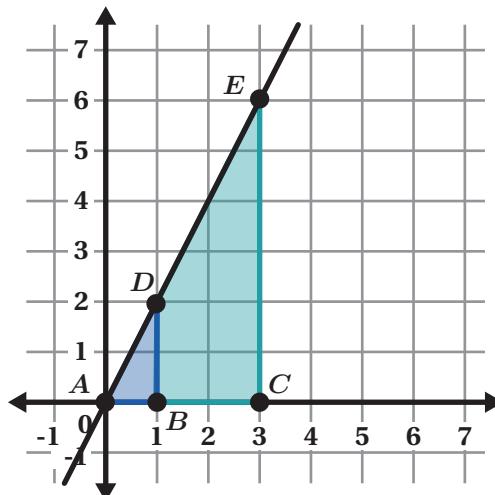

- A. 2
B. 1
C. $\frac{4}{3}$
D. $\frac{3}{4}$

Problems 9–10: Here is a diagram that shows a pair of similar figures.

9. What does the center of dilation need to be to dilate triangle ACE onto triangle ABD ?

10. What does the scale factor need to be to dilate triangle ACE onto triangle ABD ?

Reflection

- Circle the problem you enjoyed doing the most.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

Expanding is one strategy for determining if expressions with exponents are equivalent.

Here are two **powers of ten** that are equivalent to 10^8 . Each expression can be expanded to “ $10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 \cdot 10$.”

- $10^5 \cdot 10^3 = (10 \cdot 10 \cdot 10 \cdot 10 \cdot 10) \cdot (10 \cdot 10 \cdot 10) = 10^8$
- $(10^2)^4 = (10 \cdot 10) \cdot (10 \cdot 10) \cdot (10 \cdot 10) \cdot (10 \cdot 10) = 10^8$

Things to Remember:

Lesson Practice

8.7.02

Name: Date: Period:

Problems 1–2: For each expression, write an equivalent expression with a single power.
Two examples are shown.

1.

Expression	Single Power
$6^3 \cdot 6^9$	6^{12}
$2 \cdot 2^4$	
$12^5 \cdot 12^{12}$	
$7^6 \cdot 7^6 \cdot 7^6$	

2.

Expression	Single Power
$(3^7)^2$	3^{14}
$(2^9)^3$	
$(7^6)^3$	
$(11^2)^3$	

3. Which expression is equivalent to $6^4 \cdot 2^4$?

A. 8^4

B. 8^8

C. 12^4

D. 12^{16}

Problems 4–6: Here is a large rectangular swimming pool. The pool is filled to the top with water.

4. Write an expression with exponents to represent how much water the pool holds.

..... cubic feet

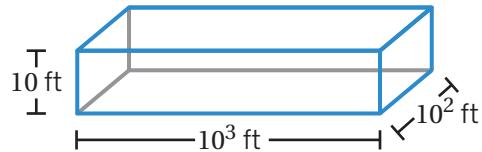

Figure may not be drawn to scale.

5. Write an equivalent expression with a single power.

..... cubic feet

6. You want to buy a cover to put on top of the pool. Write an expression with exponents to represent the area of the cover you need to buy.

..... square feet

7. Select *all* the expressions that are equivalent to 6^8 .

A. $2^8 \cdot 3^8$

B. $(6^4)^4$

C. $(6^2)^4$

D. $6^4 + 6^4$

E. $6^4 \cdot 6^2$

Lesson Practice

9. Triangle DEF is similar to triangle ABC . Label the side lengths for DE and DF .

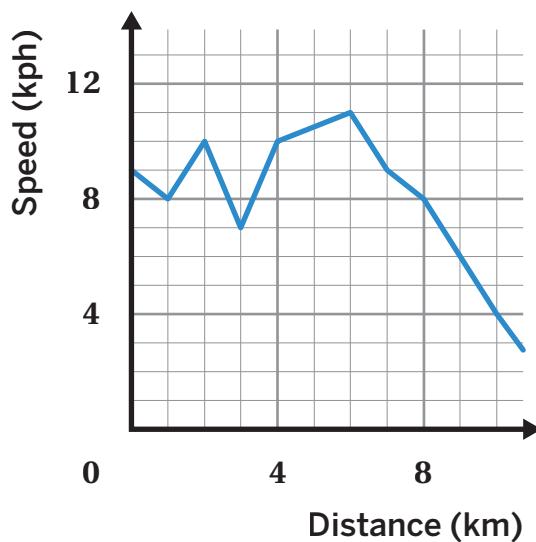

10. Solve this system of equations:

$$y = -\frac{3}{2}x + 4$$

$$y = 2x - 3$$

11. Cielo runs a 10-kilometer race. An app keeps track of Cielo's speed. Is speed a function of distance? Explain your thinking.

Reflection

- Star a problem you're still feeling confused about.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

You can rewrite expressions as a single power like 7^3 to help you make sense of more complex expressions, especially ones that involve division. Expanding is one strategy for rewriting expressions with exponents as single powers.

Here are two examples.

$$\begin{aligned}\frac{(3^3)^2}{3^4} &= \frac{(3 \cdot 3 \cdot 3) \cdot (3 \cdot 3 \cdot 3)}{3 \cdot 3 \cdot 3 \cdot 3} \\ &= \frac{3}{3} \cdot \frac{3}{3} \cdot \frac{3}{3} \cdot \frac{3}{3} \cdot 3 \cdot 3 \\ &= 1 \cdot 1 \cdot 1 \cdot 1 \cdot 3 \cdot 3 \\ &= 3^2\end{aligned}$$

$$\begin{aligned}\frac{9^2 \cdot 3^5}{3^3} &= \frac{(9 \cdot 9) \cdot (3 \cdot 3 \cdot 3 \cdot 3 \cdot 3)}{3 \cdot 3 \cdot 3} \\ &= \frac{(3 \cdot 3 \cdot 3 \cdot 3) \cdot (3 \cdot 3 \cdot 3 \cdot 3 \cdot 3)}{3 \cdot 3 \cdot 3} \\ &= \frac{3}{3} \cdot \frac{3}{3} \cdot \frac{3}{3} \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \\ &= 1 \cdot 1 \cdot 1 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \\ &= 3^6\end{aligned}$$

Knowing that $\frac{(3^3)^2}{3^4} = 3^2$ and $\frac{9^2 \cdot 3^5}{3^3} = 3^6$ can help you compare the two: $\frac{9^2 \cdot 3^5}{3^3}$ is greater than $\frac{(3^3)^2}{3^4}$ because 3^6 is greater than 3^2 .

Things to Remember:

Lesson Practice

Problems 14–15: Bananas cost \$1.50 per pound and guavas cost \$3.00 per pound. Demetrius's family spends \$12 on fruit for a breakfast they're hosting. They buy b pounds of bananas and g pounds of guavas.

- 14.** Write an equation relating the two variables.

- 15.** If Demetrius's family buys 4 pounds of bananas, how many pounds of guavas can they buy?

Reflection

- Put a star next to the problem you understood best.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

Positive, negative, and zero exponents are all related.

For example, this table shows that each time the exponent decreases by 1, the value is divided by 4. Based on this pattern, we can determine that $4^0 = 1$. Similarly, if we divide both sides of $4^0 = 1$ by 4, we get $4^{-1} = \frac{1}{4}$.

We can use these patterns to make generalizations about powers with zero and negative exponents.

- Any power with a 0 exponent is equal to 1. For example, $\left(\frac{1}{5}\right)^0 = 1$ and $(-3)^0 = 1$.
- Powers with negative exponents are equal to 1 divided by the power with a positive exponent. For example, $5^{-2} = \left(\frac{1}{5}\right)^2 = \frac{1}{5} \cdot \frac{1}{5} = \frac{1}{25}$.

Exponent Form	Expanded Form	Value
4^2	$4 \cdot 4$	16
4^1	4	4
4^0	1	1
4^{-1}	$\frac{1}{4}$	$\frac{1}{4}$
4^{-2}	$\frac{1}{4} \cdot \frac{1}{4}$	$\frac{1}{16}$

C. $4.834 \cdot 10^4$
D. $4.83 \cdot 10^5$

Spiral Review

Problems 10–12: Three stores are selling oats by the pound.

- Store A sells oats for a dollars per pound.
- Store B sells oats for b dollars per pound, with a coupon for \$5 off the total purchase.
- Store C is an online store. They sell oats for c dollars per pound, with a \$10 delivery fee.

10. Which store has the lowest price for two pounds of oats?

11. If a customer wants to buy 6 pounds of oats to make granola, which store has the lowest price?

12. How many pounds of oats would a customer need to buy to make Store C a good option? Explain your thinking.

13. Select all expressions that are equivalent to 10^{-3} .

- A. $(5 \cdot 2)^{-3}$ B. $\frac{10^6}{10^3}$ C. $\frac{1}{10^3}$ D. $(10^{-3})^{-1}$ E. $\frac{1}{1000}$

Reflection

1. Circle the problem you feel most confident about.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

Like large numbers, you can write small numbers using combinations of powers of 10. Numbers less than 1 will use negative powers of 10.

For example:

- $0.000000877 = 8 \cdot 10^{-7} + 7 \cdot 10^{-8} + 7 \cdot 10^{-9}$
- $0.0000000034 = 3 \cdot 10^{-10} + 4 \cdot 10^{-11}$
- $0.00000049 = 4 \cdot 10^{-7} + 9 \cdot 10^{-8}$

You can write large and small values as a number times a single power of 10 to help compare those values and get a sense of their scale.

For example:

- $42000000000 = 4.2 \cdot 10^{10}$
- $2500000000 = 25 \cdot 10^8$
- $0.0000000034 = 3.4 \cdot 10^{-10}$
- $0.00000049 = 49 \cdot 10^{-8}$

- Use this space to ask a question or share something you're proud of.

Lesson Summary

There are many ways to express a number using a power of 10. One specific way is called **scientific notation**, which can be helpful for comparing very large or very small numbers. When a number is written in scientific notation, the first part is a number greater than or equal to 1, but less than 10. The second part is an integer power of 10.

For example:

- 425,000,000 is $4.25 \cdot 10^8$ in scientific notation
- 0.000000000783 is $7.83 \cdot 10^{-11}$ in scientific notation

Things to Remember:

Reflection

- Put a star next to a problem where you revised your thinking.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

You can use scientific notation when comparing quantities.

Here is one example. How many jelly beans weigh as much as one Egyptian pyramid?

- Jelly bean weight: $1.5 \cdot 10^{-3}$ kilograms
- Egyptian pyramid weight: $5.216 \cdot 10^9$ kilograms

It can be helpful to round the first parts of both numbers before calculating.

- $1.5 \cdot 10^{-3}$ is about $2 \cdot 10^{-3}$.
- $5.216 \cdot 10^9$ is about $5 \cdot 10^9$.

There are many strategies you can use when comparing quantities in scientific notation.

Here are two:

Divide the larger number by the smaller number.

$$\frac{5 \cdot 10^9}{2 \cdot 10^{-3}} = 2.5 \cdot 10^{12}$$

$2.5 \cdot 10^{12}$ jelly beans weigh about the same as the pyramid.

Multiply the smaller number by the number needed to equal the larger number.

$$2 \cdot 10^{-3} \cdot ? = 5 \cdot 10^9$$

$2.5 \cdot 10^{12}$ jelly beans weigh about the same as the pyramid.

Things to Remember:

Lesson Practice

Spiral Review

Problems 8–11: A family sets out on a road trip to visit their cousins. They travel at a steady rate. The graph shows the distance to their cousins' house each hour of the trip.

8. How far is the trip?
9. How long did the trip take?
10. How fast are they traveling?

Explain your thinking

11. Is the slope positive or negative?

Explain how you know and why that fits the situation.

Reflection

1. Circle the problem you're most interested in knowing more about.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

Scientific notation can be useful for adding or subtracting very large or very small numbers. It is important to pay attention to place value when adding and subtracting numbers written in scientific notation.

For example: Let's add $3.4 \cdot 10^5 + 2.1 \cdot 10^6$.

It may appear that you can add the first parts: 3.4 and 2.1. However, these numbers *do not* have the same place value because they are multiplied by different powers of 10.

If you rewrite one number so that both numbers have the same power of 10, then you can add their first parts. In this case, let's rewrite $2.1 \cdot 10^6$ as $21 \cdot 10^5$.

$$\begin{aligned}3.4 \cdot 10^5 + 2.1 \cdot 10^6 &= 3.4 \cdot 10^5 + 21 \cdot 10^5 \\&= 24.4 \cdot 10^5 \\&= 2.44 \cdot 10^6\end{aligned}$$

Now that the power of 10 is the same, you can add 3.4 and 21. The sum is $24.4 \cdot 10^5$, or $2.44 \cdot 10^6$ when rewritten in scientific notation.

Things to Remember:

Lesson Practice

$$\boxed{} \cdot 10^{\boxed{}} + \boxed{} \cdot 10^{\boxed{}} = 3.6 \cdot 10^4$$

Spiral Review

Problems 10–13: Multiply the numbers in each expression. Write your answers in scientific notation.

10. $4.1 \cdot 10^7 \cdot 2$

11. $3 \cdot (1.5 \cdot 10^{11})$

12. $(3 \cdot 10^3)^2$

13. $(9 \cdot 10^6) \cdot (3 \cdot 10^6)$

Problems 14–15: Diego was trying to solve an equation. But when he checked his answer, he saw his solution was incorrect.

14. What would you recommend Diego change in his work?

Diego
$$-4(7 - 2x) = 3(x + 4)$$

$$-28 - 8x = 3x + 12$$

$$-28 = 11x + 12$$

$$-40 = 11x$$

$$-\frac{40}{11} = x$$

15. What is the correct solution to the equation?

Reflection

- Put a question mark next to a problem you were feeling stuck on.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

Scientific notation is a useful tool for adding, subtracting, multiplying, dividing, and comparing very small or very large numbers.

- You can rewrite the number 39,000,000,000,000 as $3.9 \cdot 10^{13}$ and still convey just how large the number is.
- To add or subtract numbers written in scientific notation, it is useful to rewrite the numbers so they have the same power of 10.
- To multiply or divide numbers written in scientific notation, it is useful to multiply or divide the numbers that come before the powers of 10. Then you can use exponent rules to multiply or divide the powers of 10.
- If the product or quotient is not written in scientific notation, you can always rewrite it to be in that form.
- Sometimes it can be helpful to round numbers written in scientific notation when exact values are less important.

Some situations that involve very large or very small numbers include salaries of wealthy people, talking about large groups like the total number of workers at a company, or the sizes of microscopic objects like cells and bacteria.

Problems 1–3: In 2022, the United States had an approximate population of $3.3 \cdot 10^8$ people. California, Texas, Florida, and New York had the greatest populations out of all the states.

1. What was the total population of all four states?

Write your answer in scientific notation.

2. What was the total population for the other 46 states? Write your answer in scientific notation.

3. About how many times greater was the population of California than the population of Florida?

State	Population (people)
California	$3.9 \cdot 10^7$
Texas	$3.0 \cdot 10^7$
Florida	$2.2 \cdot 10^7$
New York	$2.0 \cdot 10^7$

Problems 4–7: Here is a table about different life forms on our planet.

4. Which is greater: the total mass of all humans or the total mass of all Antarctic krill?

Creature	Population	Mass of One Individual (kg)
Humans	$8 \cdot 10^9$	$6.2 \cdot 10^1$
Sheep	$1.38 \cdot 10^9$	$6 \cdot 10^1$
Chickens	$3.44 \cdot 10^{10}$	$2.6 \cdot 10^0$
Antarctic krill	$8 \cdot 10^{14}$	$1 \cdot 10^{-3}$
Bacteria	$5 \cdot 10^{30}$	$1 \cdot 10^{-12}$

5. How can you tell which creature has the greatest total mass?

6. About how many more chickens are there than sheep? Write your answer in scientific notation. Show or explain your thinking.

7. Do you think kilograms would be an appropriate unit for measuring the mass of each creature listed in the table? Explain your thinking.

Lesson Summary

There are many strategies for determining the area of a tilted square. Here are two strategies called “decompose and rearrange” and “surround and subtract.”

Decompose and Rearrange

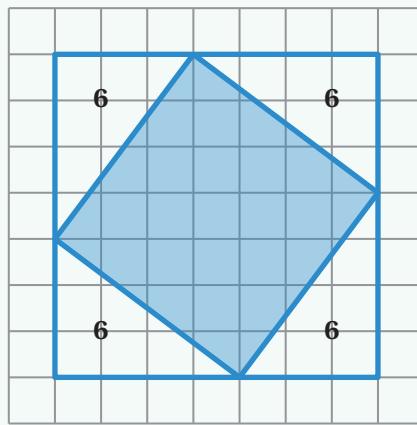

Area is calculated by adding the areas of the four triangles and one center square.

$$4 \cdot 6 + 1 = 25 \text{ square units}$$

Surround and Subtract

Area is calculated by finding the area of the large square minus the area of the four triangles.

$$7 \cdot 7 - 4 \cdot 6 = 25 \text{ square units}$$

Things to Remember:

Problems 13–14: Here is a table showing the areas of six large countries.

13. About how many times greater is the area of

Russia than the area of Canada?

14. The Eastern Hemisphere countries on this list are Russia, China, and India. The Western Hemisphere countries are Canada, the United States, and Brazil. Which has the greater total area?

A. The three Eastern Hemisphere countries

B. The three Western Hemisphere countries

Explain your thinking.

Country	Area (sq. km)
Russia	$1.71 \cdot 10^7$
Canada	$9.98 \cdot 10^6$
China	$9.60 \cdot 10^6$
United States	$9.53 \cdot 10^6$
Brazil	$8.52 \cdot 10^6$
India	$3.29 \cdot 10^6$

15. Select all the expressions that are equivalent to 10^{-6} .

A. $-\frac{1}{1000000}$

B. $\left(\frac{1}{10}\right)^6$

C. $10^8 \cdot 10^{-2}$

D. $\frac{1}{10 \cdot 10 \cdot 10 \cdot 10 \cdot 10 \cdot 10}$

E. $\frac{1}{10^6}$

Reflection

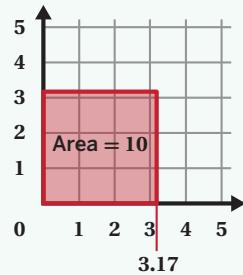

1. Circle a problem you're still curious about.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

You can use several strategies to approximate the values of square roots. One strategy is to use the areas of squares. The side length of a square is equal to the square root of its area. Another strategy is to create a table of values for n and determine n^2 . Remember that $(\sqrt{n})^2 = n$. Below is a description of how each strategy can be used to approximate $\sqrt{10}$.

Using Squares

- Create a square that has an area equal to about 10 square units.
- Approximate the side length of the square created.

**Using a Table**

- Create a table of decimal value guesses for n .
- Calculate n^2 for each guess of n .
- The closer n^2 is to 10, the better that value of n is as an approximation for $\sqrt{10}$.

n	n^2
3.1	9.61
3.16	9.9856
3.17	10.0489
3.165	10.017225

9. Identify two points on a line that would create a slope of 6.

Use the coordinate plane if it helps with your thinking.

Problems 10–12: Here is a scatter plot that shows the heights and weights of 25 dogs, as well as a linear model for the same situation and its equation.

10. What does the slope of the linear model mean in this situation?

11. Based on the model, what will be the weight of a dog that is 25 inches tall?

12. Does the data show a positive or negative association?

Explain your thinking.

Reflection

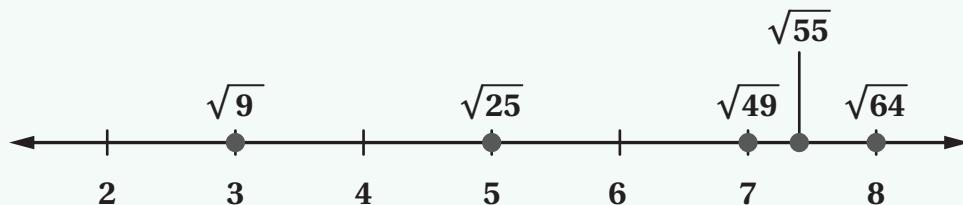

- Put a star next to a problem you could explain to a classmate.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

You can represent a square root on a number line. We write a solution to an equation, such as $x^2 = 3$, using square root notation. The positive solution to this equation is $x = \sqrt{3}$.

You can approximate a square root on a number line by observing the whole numbers around it.

For example, you can determine that $\sqrt{55}$ is between 7 and 8 because $7^2 = 49$ and $8^2 = 64$, and 55 is between 49 and 64. More precisely, $\sqrt{55}$ should be plotted slightly left of 7.5 since it is closer to 7 than 8.

A **perfect square** is a number that is the square of an integer. For example, 49 is a perfect square because $7 \cdot 7 = 7^2 = 49$, but 55 is not a perfect square because no integer can be squared to equal 55.

10. $(2 \cdot 10^3)(3.4 \cdot 10^{11})$

11. $\frac{4.6 \cdot 10^3}{2 \cdot 10^5}$

Problems 12–13: This scatter plot shows the heights (in inches) and the three-point percentages for different basketball players last season.

12. Predict the three-point percentage for a player who is 70 inches tall.

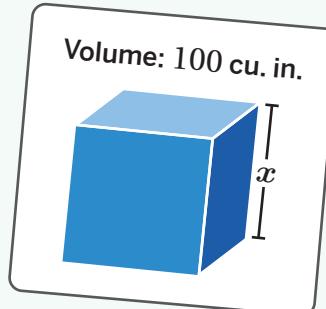

13. Identify a data point that appears to be an outlier.

Reflection

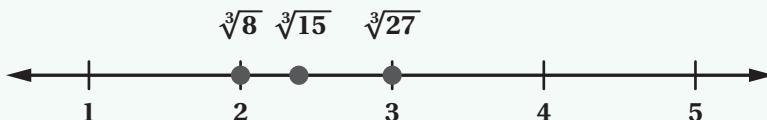

- Circle a problem you want to talk to a classmate about.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

A **cube root** describes the edge length of a cube given its volume. For the cube shown with a volume of 100 cubic inches, the equation $x^3 = 100$ can help you find its edge length. Its exact solution would be represented as $x = \sqrt[3]{100}$.

We can approximate a cube root on a number line by observing the whole numbers around it. For example, you can determine that $\sqrt[3]{15}$ is between 2 and 3 because $2^3 = 8$ and $3^3 = 27$, and 15 is between 8 and 27.

8 and 27 are perfect cubes because they are both the cube of an integer:
 $2 \cdot 2 \cdot 2 = 2^3 = 8$ and $3 \cdot 3 \cdot 3 = 3^3 = 27$.

Things to Remember:

Lesson Practice

8.8.05

Name: Date: Period:

1. What is the volume of each cube based on its edge length?

	Edge Length	Volume
Cube A	4 cm	
Cube B	$\sqrt[3]{11}$ ft	
Cube C	s units	

2. What is the exact edge length of each cube based on its volume?

	Edge Length	Volume
Cube D		1,000 cu. cm
Cube E		23 cu. in.
Cube F		v cu. units

Problems 3–6: Write an equivalent expression that doesn't use a cube root symbol.

3. $\sqrt[3]{1}$

4. $\sqrt[3]{216}$

5. $\sqrt[3]{\frac{27}{125}}$

6. $\sqrt[3]{\frac{1}{64}}$

Problems 7–10: Write an exact solution to each equation.

7. $t^2 = 64$

8. $f^3 = 181$

9. $m^2 = 8$

10. $c^3 = 343$

11. Plot each cube root on the number line.

Spiral Review

14. What two consecutive whole numbers does $\sqrt{40}$ lie between?

A. 4 and 5 B. 5 and 6 C. 6 and 7 D. 7 and 8

15. Which set of ordered pairs represents a function?

A. $\{(-5, 10), (-20, 0), (-20, 25)\}$ B. $\{(-10, 0), (-10, 5), (-10, 25)\}$
C. $\{(-25, 0), (5, -10), (-25, 30)\}$ D. $\{(-20, 0), (5, -10), (30, -25)\}$

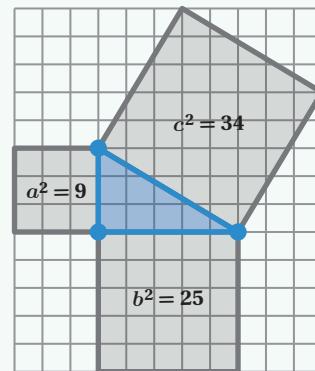

Reflection

1. Circle the problem you feel most confident about.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

The **Pythagorean theorem** says that for right triangles, $a^2 + b^2 = c^2$, where a and b represent the lengths of the two shorter sides and c represents the length of the longest side.

The relationship $a^2 + b^2 = c^2$ is only true for right triangles.

For triangle H :

$$(\sqrt{10})^2 + (\sqrt{17})^2 = 27$$

$$c^2 = (\sqrt{29})^2 = 29$$

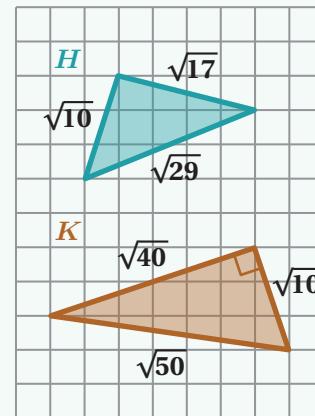

$27 \neq 29$ so $a^2 + b^2 = c^2$ is not true.

For triangle K :

$$(\sqrt{10})^2 + (\sqrt{40})^2 = 50$$

$$c^2 = (\sqrt{50})^2 = 50$$

$50 = 50$ so $a^2 + b^2 = c^2$ is true.

Problems 7–9: A teacher tells her students she is just over 1.5 billion seconds old.

7. Write her age in seconds using scientific notation.

8. What is a more reasonable unit of measurement for this situation?

9. Convert the teacher's age to a new unit. Show or explain your thinking.

10. Kwasi is jogging in a 30-kilometer trail race. The equation $y = -6x + 30$ represents this situation, where y is the distance, in kilometers, that Kwasi has left to run after x hours. How much further will Kwasi have to run after 3.5 hours?

A. 6

B. 9

C. 21

D. 30

Reflection

- Put a star next to a problem where you revised your thinking.
- Use this space to ask a question or share something you're proud of.

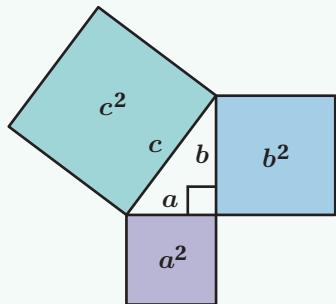

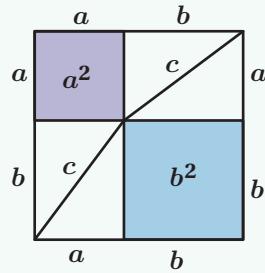

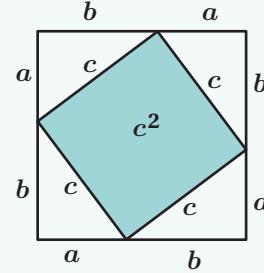

Lesson Summary

The Pythagorean theorem states that for any right triangle, $a^2 + b^2 = c^2$. There are many proofs for the Pythagorean theorem.

One proof involves drawing squares on the sides of a right triangle, like in Figure 1. You can cut up pieces of the smaller squares to equal the area of the larger square.

Another involves rearranging triangles. Make a square where each side is $(a + b)$ units long (like Figures 2 and 3).

You can fill each large square with 4 small right triangles, a^2 and b^2 (Figure 2) or the same four small triangles and c^2 (Figure 3). Since the total area and the area of the four small triangles are the same, $a^2 + b^2$ has to equal c^2 .

2. Use this space to ask a question or share something you're proud of.

Lesson Summary

The **hypotenuse** is the side of a right triangle that is opposite the right angle, and is the longest side. Only right triangles have a **hypotenuse**. The **legs** of a right triangle are the sides that make the right angle.

The Pythagorean theorem says that in a right triangle, the sum of the squares of the lengths of the legs is equal to the square of the length of the hypotenuse. This can be represented by the equation $a^2 + b^2 = c^2$, where a and b represent the lengths of the legs and c represents the length of the hypotenuse.

When any two side lengths of a right triangle are known, the Pythagorean theorem can be used to calculate the length of the third side, whether it is the hypotenuse or a leg. You can substitute the lengths you know into the equation $\text{leg}^2 + \text{leg}^2 = \text{hypotenuse}^2$ or $a^2 + b^2 = c^2$, and then solve for the unknown value.

- Use this space to ask a question or share something you're proud of.

Lesson Summary

If a triangle has side lengths a , b , and c , where c is the longest side and $a^2 + b^2 = c^2$, then the converse of the Pythagorean theorem says that you must have a right triangle. We can use this to determine whether any triangle is a right triangle. If the sides of a triangle *do not* make the equation $a^2 + b^2 = c^2$ true, then you know it is *not* a right triangle.

In the triangle shown, let $a = 6$, $b = 6$, and $c = 8$. You can use substitution to determine whether the triangle is a right triangle.

$$\begin{aligned}a^2 + b^2 &= 36 + 36 \\&= 72\end{aligned}$$

Because $c^2 = 8^2$, or 64, the triangle cannot be a right triangle because $a^2 + b^2 \neq c^2$.

2. Use this space to ask a question or share something you're proud of.

Lesson Summary

The Pythagorean theorem can be used to solve problems that can be modeled with right triangles. The sides of a triangle might represent units such as the length of an object or the distance between two objects.

To apply the Pythagorean theorem, the lengths of two sides must be known so the length of the third side can be determined.

For example, you can use the Pythagorean theorem to calculate the distance to walk through the park from point *A* to point *B*.

Let the length of the path through the park equal c .

$$c^2 = (200)^2 + (200)^2$$

$$c^2 = 40000 + 40000$$

$$c^2 = 80000$$

$$c = \sqrt{80000}$$

- D. (2, 0)

Reflection

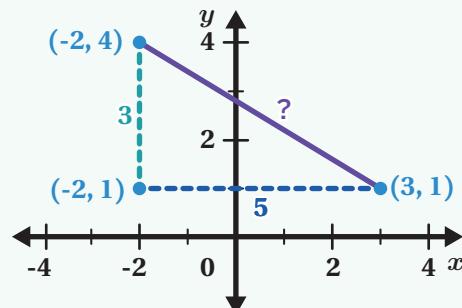

1. Put a star next to a problem that looked more difficult than it really was.
2. Use this space to ask a question or share something you're proud of.

Lesson Summary

You can use the Pythagorean theorem to calculate the distance between two points on a diagonal line segment. Start by drawing horizontal and vertical legs to form a right triangle. Then use the Pythagorean theorem to calculate the length of the hypotenuse, which will be the distance between the two points.

Calculate the distance between two points on a horizontal line by determining the absolute value of the difference between their x -coordinates. The distance between $(-2, 1)$ and $(3, 1)$ is $| -2 - 3 | = 5$ units.

Similarly, you can calculate the distance between two points on a vertical line by determining the absolute value of the distance between their y -coordinates. The distance between points $(-2, 4)$ and $(-2, 1)$ is $| 4 - 1 | = 3$ units.

$$\text{leg}^2 + \text{leg}^2 = \text{hypotenuse}^2$$

$$3^2 + 5^2 = x^2$$

$$9 + 25 = x^2$$

$$34 = x^2$$

$$\sqrt{34} = x$$

Lesson Summary

You can write every number as a decimal. Some fractions can be written as terminating decimals, while others can be written as repeating decimals. To write a fraction as a decimal, you can use long division.

For example, here is how you can use long division to rewrite $\frac{1}{15}$ as a decimal.

To avoid writing the repeating part of a decimal over and over, you can use **bar notation**, which shows a line over the part of the decimal that repeats. For example, when writing $\frac{1}{15}$ as a decimal, you would write 0.06666... as $0.\overline{06}$.

$$\begin{array}{r} 0.06666\dots \\ 15)1.00 \\ -90 \\ \hline 100 \\ -90 \\ \hline 100 \\ -90 \\ \hline 10 \end{array}$$

Problems 10–11: The numbers x and w are positive. Determine the exact value of each variable.

10. $x^2 = 90$

11. $w^2 = 36$

Reflection

- Put a star next to a problem that looked more difficult than it really was.
- Use this space to ask a question or share something you're proud of.

Lesson Summary

You can express all repeating decimals as fractions. One way to do this is to multiply equations by factors of 10 until the repeating decimals can subtract to 0. Once the repetition is removed, the resulting equation can be solved and left in fraction form.

For example, see these steps to represent $0.\overline{57} = 0.575757575\dots$ as a fraction.

If a decimal expansion of a number is a repeating or terminating decimal, the number can be written as a fraction. If the digits in the decimal expansion do not repeat (non-repeating) and do not terminate (non-terminating), then the number cannot be written as a fraction.

$$x = 0.\overline{57}$$

$$10x = 5.\overline{75}$$

$$100x = 57.\overline{57}$$

$$100x = 57.\overline{57}$$

$$-(x = 0.\overline{57})$$

$$99x = 57$$

$$x = \frac{57}{99}$$

$$0.\overline{57} = \frac{57}{99}$$

Lesson Summary

A **rational number** is a number that can be written as a fraction of two integers, where the denominator is not zero. An **irrational number** is a number that cannot be written in that way.

Here are some examples of rational and irrational numbers.

Examples of Rational Numbers

- Fractions: $\frac{10}{5}$, $3\frac{11}{20} = \frac{71}{20}$
- Terminating decimals:
 $1.5 = \frac{3}{2}$, $1.73 = \frac{173}{100}$
- Repeating decimals:
 $1.\overline{73} = \frac{172}{99}$, $0.1212\dots = \frac{12}{99}$
- Square roots of perfect squares and cube roots of perfect cubes:
 $\sqrt[3]{8} = \frac{2}{1}$, $\sqrt{64} = \frac{8}{1}$, $\sqrt{\frac{1}{9}} = \frac{1}{3}$

Examples of Irrational Numbers

- Non-terminating, non-repeating decimals: π , $0.743\dots$, $2.742050\dots$
- Square roots of non-perfect squares and cube roots of non-perfect cubes:
 $\sqrt{2}$, $3 \cdot \sqrt{5}$, $\sqrt[3]{9}$
