SUPPLY LIST:

Lesson 3 - Fun Physics Tricks

- 1 bottle with a narrow neck
- Piece of paper or a dollar bill
- 5 quarters
- 3 matches or flat-tipped toothpicks
- 1 shoelace
- 2 books of approximately the same size

Lesson 15 - Cup Stack Challenge

- 5 stackable paper cups
- 4 index cards or squares of paper
- 15 coins (any type)
- 4-6 short lengths of string or ribbon
- Tape

Lesson 18 - Inertia Experiments Egg Splash

- Toilet paper tube
- 1 "light" egg
- 1 "heavy" egg
- Aluminum pie pan or piece of cardboard
- A large cup
- Rag or towel (for cleanup)

Tablecloth Pull

- Smooth cloth or scarf
- Bath towel
- Flat table surface
- Unbreakable dishes or water bottles

Inertia Hat

- Wire cutters (optional)
- Wire hanger
- 2 balls (tennis, wiffle) or other objects

Lesson 21 - Racing Balloons

- 2 Balloons
- 2 straws
- 30+ feet of thread or fishing line
- 30+ feet of twine
- Tape
- Clip or clothespin (optional)

Lesson 24 - Gravity Project

Water Rocket Lab*

- Empty plastic 2 liter or 1 liter bottles
- A rubber cork and tubing to fit to a bike pump
- Fins to stabilize the bottle

Bike pump

Hang Time Lab

- A tennis ball to throw
- Camera or stopwatch for timing
- Ball launcher

Horizontal Motion and Gravity Lab

- 2 identical coins
- Camera for timing
- Ruler
- Measuring tape

Lesson 30 - Double Bounce

- A larger ball that bounces such as a basketball or soccer ball
- A smaller ball that bounces such as a tennis ball or racquet ball
- Camera (for timing)
- Glue gun (optional)

Lesson 33 - Wheels and Rotation

Racing Wheels

- 12 Small paper plates
- 3 Pencils
- Pennies or other small weights such as nuts or bolts
- Tape or glue
- Sloped table or ramp
- Nail or drill to make a hole in a paper plate

Center of Mass

- Paperclip
- Pencil or pen
- Push pin
- Cardboard cereal box
- Straight edge
- String or yarn

Lesson 36 - Tensegrity Table

- At least 12 popsicle sticks
- 60 cm (2ft) of string
- A drill
- Hot glue, super glue, or duct tape

Lesson 39 - Rube Goldberg Machine

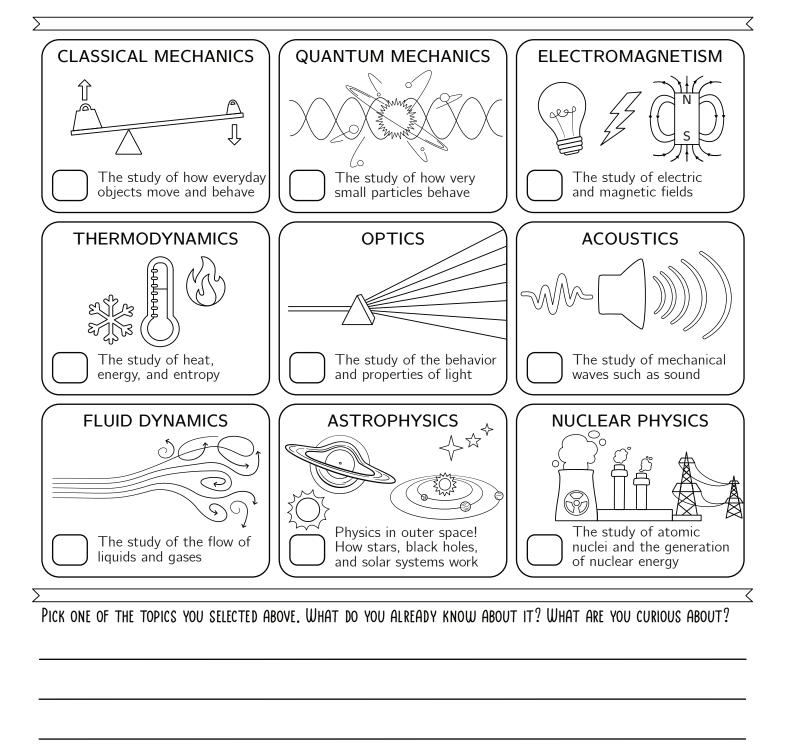

• Use any supplies you have on hand!

^{*}A water rocket kit is recommended for this activity

PHYSICS - THE FUNDAMENTAL SCIENCE

If you could spend a day working with a physicist, which of these areas would you like to explore? Put a star or checkmark by your top three choices.

FOR BEST LEARNING

(1)	DO	THE	HAN	DS-ON	AC	TIVI	ΓIES
\ \ \ /	C	- 11	c . ı	11			_

Gather all of the supplies in advance. Record your results and share them with a friend.

ILL YOU G SPECIFIC P		HERE WILL	_	' Who w	JILL YOU	SHARE	RESULTS	WITH AND	HOW?

2 USE THE NOTES

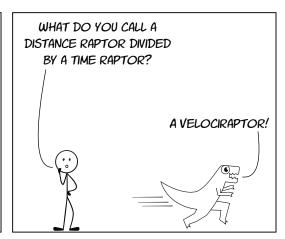

Fill them out! This can be done in advance, during, or after watching the video lesson.

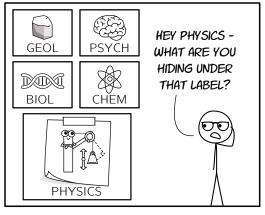

Make a specific i		00000		

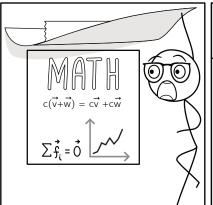

(3) LEARN THE VOCABULARY

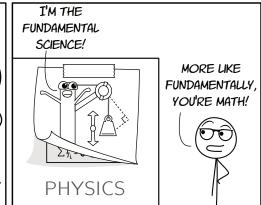

Play the physics vocab memory game, use the vocab list to make flashcards, redefine the terms in your own words, or practice using physics terms in everyday conversations.

Make a	SPECIFIC	PLAN	FOR	o o d Learning	 LANGUAGE	OF PHYSICS:

DO ALL OF THE PRACTICE PROBLEMS

Each lesson has a page or two of practice problems that should be completed individually after each lesson. Solve them on your own before looking at the answer key!

The practice problems will:

- Give you a solid foundation for more advanced science courses
- Strengthen your critical thinking and reasoning skills
- Show you how math can be used to solve real-world problems
- Prepare you to defeat Math Dad in our quiz shows

0000	
MAKE A SPECIFIC PLAN FOR CONQUERING THE PRACTICE PROBLEMS. WHEN AND WHERE WILL YOU WORK ON TH	IEM?
JHAT WILL YOU DO IF THERE IS A PROBLEM YOU DON'T UNDERSTAND?	
WHAT WILL YOU DO IF THERE IS A LESSON OR SET OF PRACTICE PROBLEMS THAT FEEL TOO EASY OR BORING	?
HOW WILL YOU MEASURE YOUR PROGRESS OR CHECK YOUR WORK?	

ARE YOU READY FOR PHYSICS?

To build a strong knowledge base in physics you'll need some math skills! How do you feel about each of these areas? If your knowledge is shaky in one of these topics, you should strengthen it before starting this course.

(\Leftrightarrow)

NUMBERS & ARITHMETIC

Strong arithmetic skills with addition, subtraction, multiplication, division, fractions, and decimals.

Can perform calculations using both positive and negative numbers and use a calculator to carry out more complex calculations.

For example: Use a calculator to find the decimal approximation of the number $\sqrt{31}$ accurate to two decimal places.

___x

SLOPE & COORDINATE PLANE

Be able to plot and interpret points in the plane.

Can interpret the meaning of a simple graph.

Know that slope is rise over run.

3a=12

VARIABLES & EQUATIONS

Know that a variable is a letter or symbol representing an unknown value.

Be able to substitute a value in place of a variable.

Can solve a simple equation involving a variable.

For example: 3 + a = 5. What is a? 4x = 12. What is the value of x?

2³

EXPONENTS

Understand and be able to expand exponents.

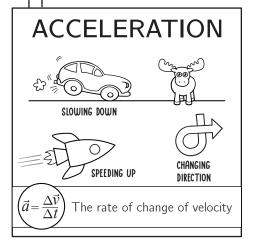

For example: 10³ means 10·10·10, which equals 1,000.

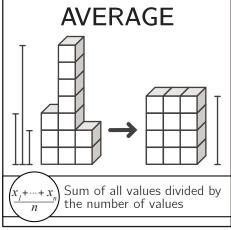

Can recognize and interpret numbers in scientific notation (Optional. We won't use scientific notation often and it could be picked up during class.)

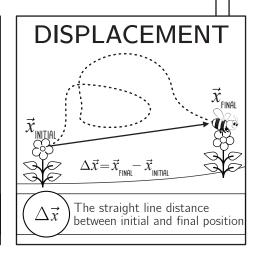

For example: $4.5 \times 10^4 = 45,000$

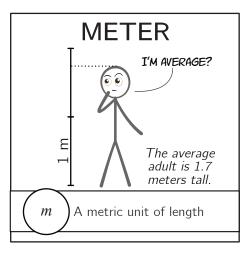

Unit 1: Kinematics

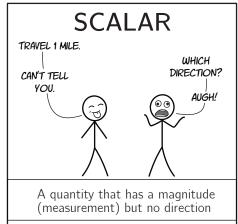

This unit covers how to describe and explain the motion of objects using graphs, diagrams, numbers, and words. Kinematics is all about how measurements are made!

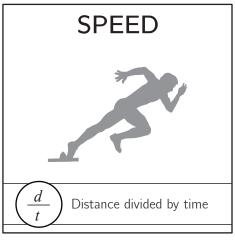

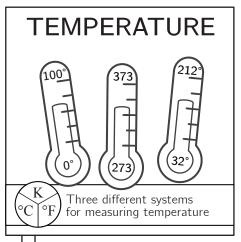

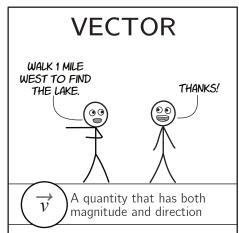

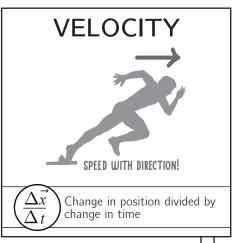

The science of motion!

The metric system or SI (International System of Units) is the international ______ of measurement. The SI has 7 base ______ that are defined in relation to universal constants. One _____ of SI is that it has only _____ unit for each quantity or type of measurement. SI systems uses the same _____ to represent multiples or powers of 10. Kilo means 1,000, so a kilometer will always have 1,000 meters and a kilogram contains 1,000 grams, etc.

CONVERTING UNITS:

Use the steps shown in the two examples below to complete the next conversions:

IN MATHEMATICS, WE CAN ALWAYS ADD ZERO, MULTIPLY

BY ONE, OR SUBSTITUTE SOMETHING OF EQUAL VALUE.

1. HOW MANY FEET LONG IS A MARATHON?

A marathon is 26.2 miles. There are 5,280 feet in 1 mile.

26.2 mi = 26.2 mi · 1
$$\leftarrow$$
= 26.2 mi · $\frac{5,280 \text{ ft}}{1 \text{ mi}}$

$$= \frac{26.2 \text{ mi} \cdot 5,280 \text{ ft}}{1 \text{ mi}}$$

$$= 138,336 \text{ ft}$$

2. HOW MANY METERS TALL IS MATH DAD?

There are 3.28 feet in 1 meter. Math Dad is 5.5 ft tall.

$$5.5 \text{ feet} = 5.5 \text{ ft} \cdot 1$$

$$= 5.5 \text{ ft} \cdot \frac{1 \text{ m}}{3.28 \text{ ft}}$$

$$=\frac{5.5 \text{ ft} \cdot 1 \text{ m}}{3.28 \text{ ft}}$$

$$= 1.68 \text{ m}$$

3. How many marathons would it take to equal the circumference of the Earth?

Circumference of the Earth = 24,902 miles.

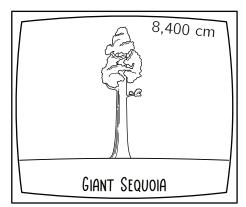

4. HOW MANY MINUTES ARE THERE IN JUNE?

	— ←
ſ <u> </u>	0 1
JUNE	

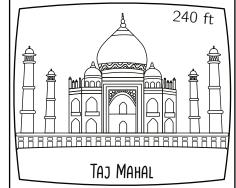

When we multiply a number by a unit conversion fraction, we're really just multiplying by 1!

Measuring is an important tool in physics. Can you rank the following from shortest to tallest? Each has been measured accurately, but the measurements are in different units!

Use the table to convert each of the measurements above to meters. Then sketch each object onto the grid below to see how they compare in height to the Great Pyramid of Giza.

IMPERIAL SYSTEM

1 foot = 12 inches

1 mile = 5,280 feet

METRIC SYSTEM

1 meter = 1,000 millimeters

1 meter = 100 centimeters

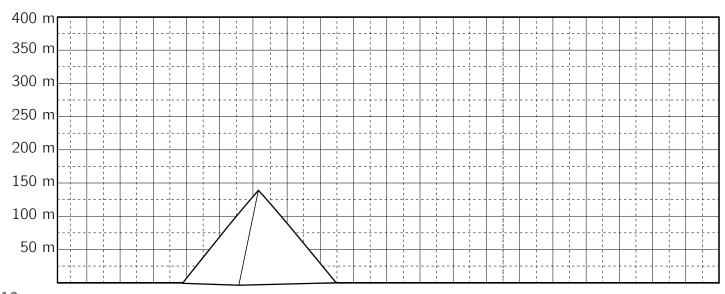

1 kilometer = 1,000 meters

CONVERTING IMPERIAL TO METRIC

1 inch \approx 2.54 centimeters

1 mile ≈ 1.609 kilometers

1 foot ≈ 0.3 meters

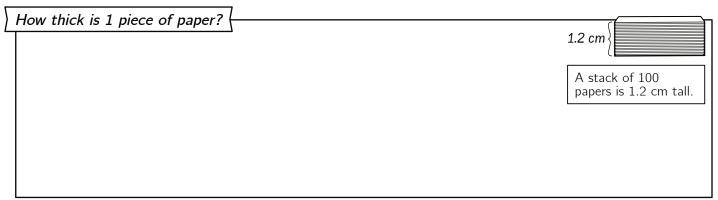

OOOOOO DIRECT VS INDIRECT MEASUREMENT OOOOO

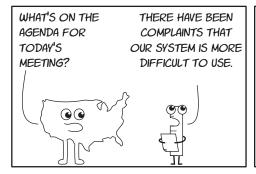

Some things, like the volume of a jar, can be measured directly. When candy is in a sealed jar, the number of candies can't be counted directly, but measurements can be used to give a good *estimation*.

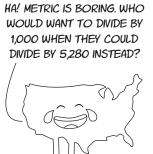

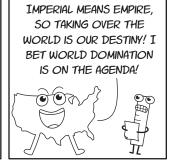

A single piece of paper is too thin to be measured with a ruler – or is it? Use the clues below to measure the thickness of a piece of paper *indirectly!*

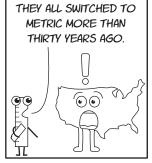

A MEETING OF IMPERIAL MEASURES

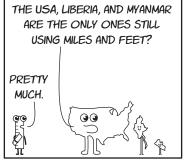

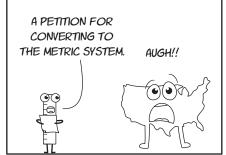

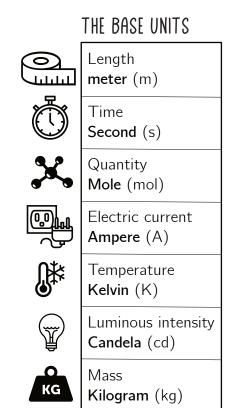

The distance from the North Pole to the equator divided by ten million 1/86,400 of a day

of carbon

1/10 the electric current that produces a certain amount of force

The number of atoms in 12 grams

Celsius minus 273 degrees (the C° temperature scale comes from the freezing/boiling points of water)

The brightness of a standard candle flame

The weight of one liter of water

BASE UNITS CAN BE COMBINED TO MAKE MANY MORE UNITS!

Circle the units you've seen before. Put a box around ones that are new or unfamiliar.

hertz pascal newton

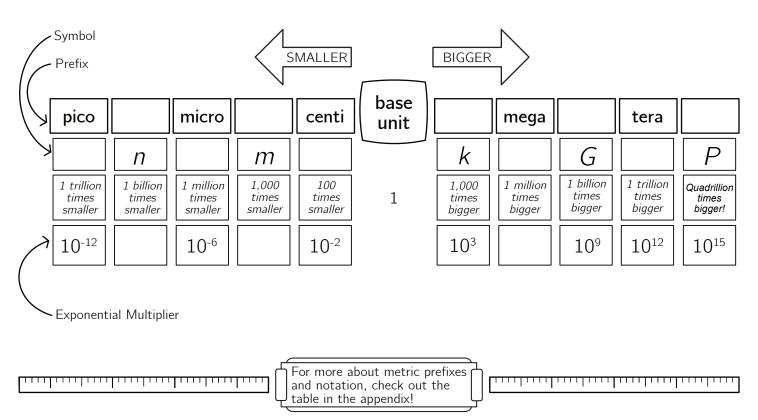

volt watt ohm joule lumen

farad

sievert coulomb

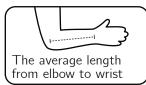

Fill in the missing prefixes, symbols, and multipliers below:

PRACTICE PROBLEMS - MIGHTY MEASURES

MATCHING LENGTHS:

Draw a line to match each distance with its best measurement.

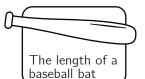

1 km

The width of a credit card.

1 mm

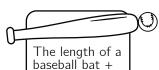

1 in

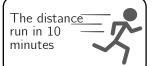

The average width of a pinky finger

1 yd

1 ft

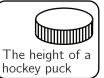

1 mi

1 cm

The distance walked in 10 minutes

A TABLE ON COMPUTER DATA:

Use your knowledge of the metric system to complete the table below and fill in the blanks below:

Unit:	Number of bytes:
byte	1
Kilobyte (KB)	1,000
Megabyte (MB)	
Gigabyte (GB)	
Terabyte (TB)	
Petabyte (PB)	

_____ KB = 1 MB.
_____ megabytes = 1 gigabyte.

1 terabyte = _____ megabytes.

GB = 1 PB

How many kilobytes are in a petabyte?

PRACTICE PROBLEMS - MIGHTY MEASURES

Convert units to answer each question. Practice doing neat work!

- \bigcirc Jerry says he'll trade Jill 41 dimes for 16 quarters. Jill agrees. Who has more money after the trade and why?
- 2 How many dollars are the same value as 61 quarters?

(3) How many Abs are in 10 Gabs?

1 Ab = 4 Babs 3 Babs = 7 Cabs 2 Cabs = 3 Dabs

7 Dabs = 1 Fab

6 Fabs = 1 Gab

(Challenge Question 1:) How many Fabs are in 8 Babs?

WHERE ARE WE GOING? HOW SHOULD I KNOW? I'M JUST FOLLOWING YOU!

(Challenge Question 2:)

The pine processionary caterpillar (*Thaumetopoea pityocampa*) is 4 cm long. When migrating, the caterpillars march in a single-file line. If a line of caterpillars is just under 1 mile long, then how many caterpillars are marching in the line?

FUN PHYSICS TRICKS

MATERIALS

1 water bottle with a narrow neck and lid that can be partially filled with water

1 shoelace or 60 cm (2 ft) of yarn

flat-tipped

toothpicks

\$ 0 \$

A dollar bill or similarlysized piece of paper

2 books that are approximately the same size

5 quarters

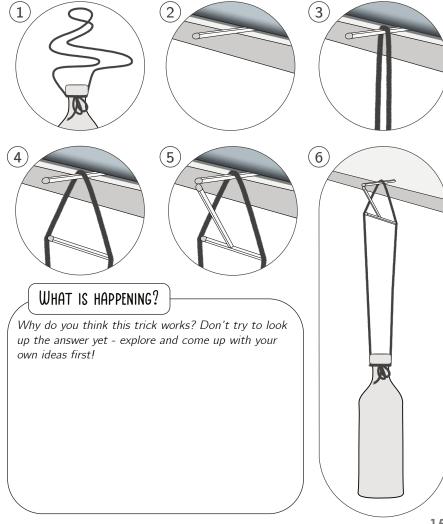

GOALS

- Experience curiosity and wonder about physics!
- Get hands-on experience with physics principles that we will learn about later in this course.
- Bonus: Learn 3 tricks that can stump your friends and family members!

MIGHTY MATCH CHALLENGE

Can you hang a water bottle from the edge of a table using only 3 matches and yarn?

- 1. Tie the yarn to a water bottle that is ¼ full of water. For best results, the bottle should not weigh more than 0.4 kg (1 pound or 16 ounces). The yarn should extend from the bottle in one long loop. Make sure the yarn is secure and supports the weight of the bottle.
- 2. Place a match on the edge of a table so that it dangles a bit more than half-way over the edge. Place a counterweight (such as the two books) on the end of the match to hold it in place.
- 3. Hang the bottle from the match so that the string is up against the side of the table.
- 4. Place a second match about one match length below the match that is placed on the table and orient it so that it is wedged between the two strands of string.
- 5. Wedge a third match between the two matches so that the heads are touching. Adjust as needed.
- 6. Once the matches are steady, remove the counterweight.

FUN PHYSICS TRICKS

DOLLAR BILL CHALLENGE

- 1. Place a dollar bill on a bottle and then place 5 large coins such as quarters on top. Challenge a friend to remove the bill without touching the bottle or knocking off the coins.
- 2. To remove the bill, pinch one end of the bill with one hand. Don't pull. This hand need to remain stationary.
- 3. Push down with your other index finger to form a bit of a valley.
- 4. Slap down quickly with the flat index finger, pushing on the area where the dip in the dollar bill was. The other hand that is pinching the dollar bill should remain stationary.

With a bit of practice, you'll be able to push fast enough on the bill that it will slide out but the the coins will stay in place!

Can you pull the dollar from beneath the coins without them falling off?

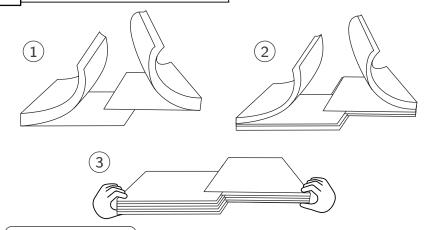

WHAT IS HAPPENING? Why do you think this trick works? Don't try to look up the answer yet. First explore and come up with your own idea!

3)BOOK PULL CHALLENGE

- 1. Take two books or two packs of post-it notes and place them on a table or other flat surface. Hold up all but the back cover and overlap the back covers so that ¼ to ½ of one of the pages is covered by the other book.
- 2. Let the pages flip down so that they alternate.
- 3. Once the pages have been interwoven and the books are closed, challenge someone to hold on the spine of each book and pull them apart.

Can you pull two books apart when the pages are overlapped?

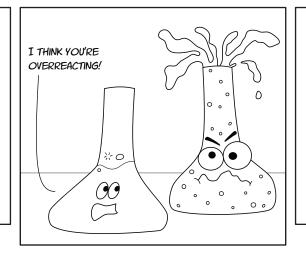

WHAT IS HAPPENING? Why do you think this trick works? Don't try to look up the answer yet. Explore and come up with your own ideas first!

1 MIGHTY MATCH CHALLENGE	Did the demonstration work? What tips would you give someone else trying this for the first time? Did the activity spark any questions or discoveries?		
	id the demonstration work? What tips would you give someone else trying his for the first time? Did the activity spark any questions or discoveries?		
~ !	d the demonstration work? What tips would you give someone else trying is for the first time? Did the activity spark any questions or discoveries?		

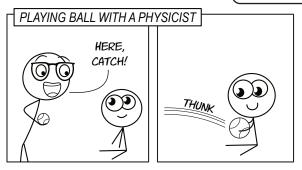

A PERSON WHO
HAS MADE ALL
THE MISTAKES
THAT CAN BE
MADE IN A VERY
NARROW FIELD.

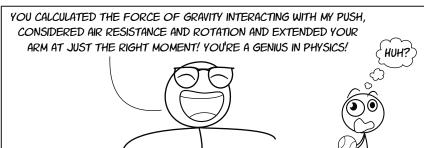

-NIELS BOHR

If at first you don't succeed, analyze, revise, and then try again.

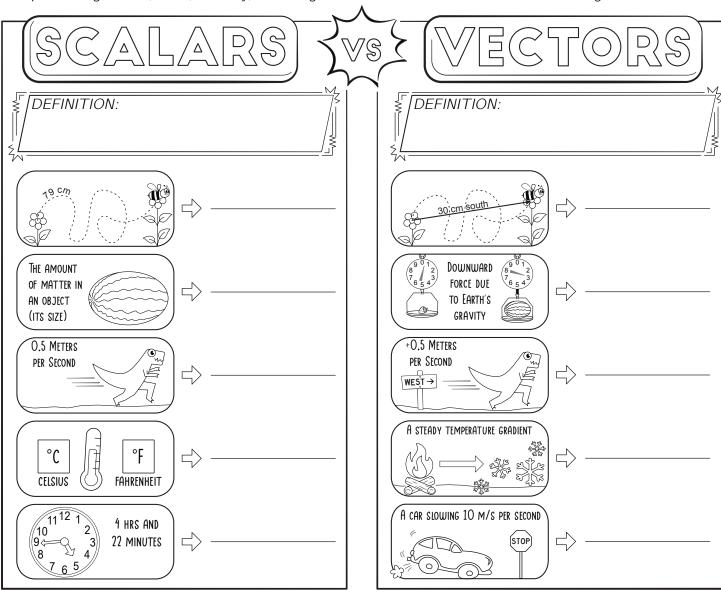

MEASURING MOTION

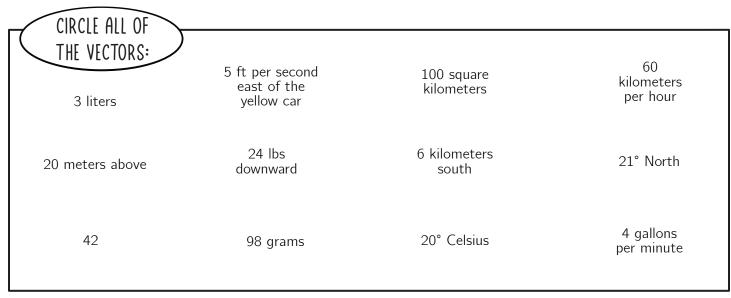

You already have a lot of experience with **mechanics**, the branch of physics that studies the motion of objects. Understanding vectors will help give you tools to make models and speak the language of physics!

The terms illustrated below are: acceleration, displacement, distance, mass, speed, temperature, temperature gradient, time, velocity, and weight. Write each term next to the matching illustration.

In physics, the size or measurement of something is ca	lled its A quantity that
tells us the magnitude but NOT the direction is called	a quantity. Often, we need
to know both measurement AND The d	irection can be described in relation to an
object using terms like up, down, north, south, east, w	est, left, or right. A quantity that has
both a magnitude and a direction is called a	quantity.

Below are the courses for three different races. Use the scale and compass to estimate both the distance and displacement from the start of each race to the finish of each race.

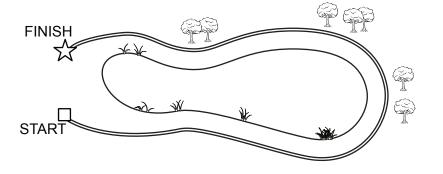

1 km

START	FINISH
	

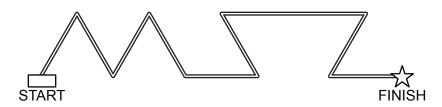

Distance: _____

Displacement:

Distance:

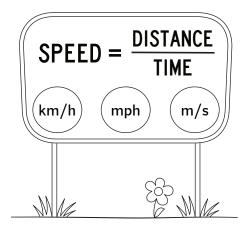

Displacement:

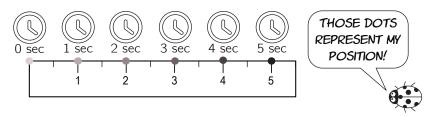

SCIENCE MMM

Distance:

Displacement:

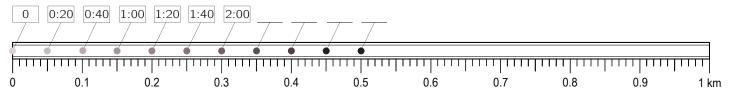

When we know the distance traveled and how much time it took, we can calculate how fast an object was moving, or its **speed**. The ladybug on the ruler moved 5 cm in 5 seconds, so its speed is 5 cm/5 seconds or 1 cm/s.

CALCULATING SPEED

The dots below indicate the position of a runner every 20 seconds as they run along a path.

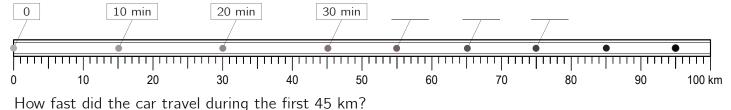

How far did they run? Be sure to include units in your answer!

How fast did they run? (Answer in km/hr)

Assuming the runner kept the same pace, how long will it take to run 1 kilometer?

The dots below indicate the position of a car every 10 minutes driving south.

When did the car slow down?

How long did it take the car to reach the 75 km mark?

PRACTICE PROBLEMS - TRACKING MOTION

IS IT A VECTOR?

Draw lines to classify each measurement below as either a vector, a scalar, or neither a vector or scalar.

100 kg

VECTOR

400 ft²

-10 °F

enormous

 $8 \text{ m/s}^2 \text{ down}$

SCALAR

20 gal/min

29 cm

32

30 m south

NEITHER

north

MEASURE THIS MOTION:

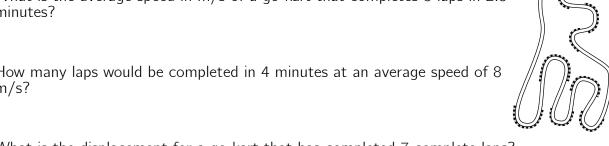

1 Eli travels around the equator of the world in 70 days, arriving back in the exact same position from which he started his journey. What is his displacement?

- 2 Aisha and Arjun are training to run a 5K race. They ran for 24 minutes and want to know if they reached their daily running goal of completing 3 kilometers. Which will be most useful in answering their question: distance or displacement?
- (3) Kat drove 200 miles in 4 hours. What was her average speed?

PRACTICE PROBLEMS - TRACKING MOTION

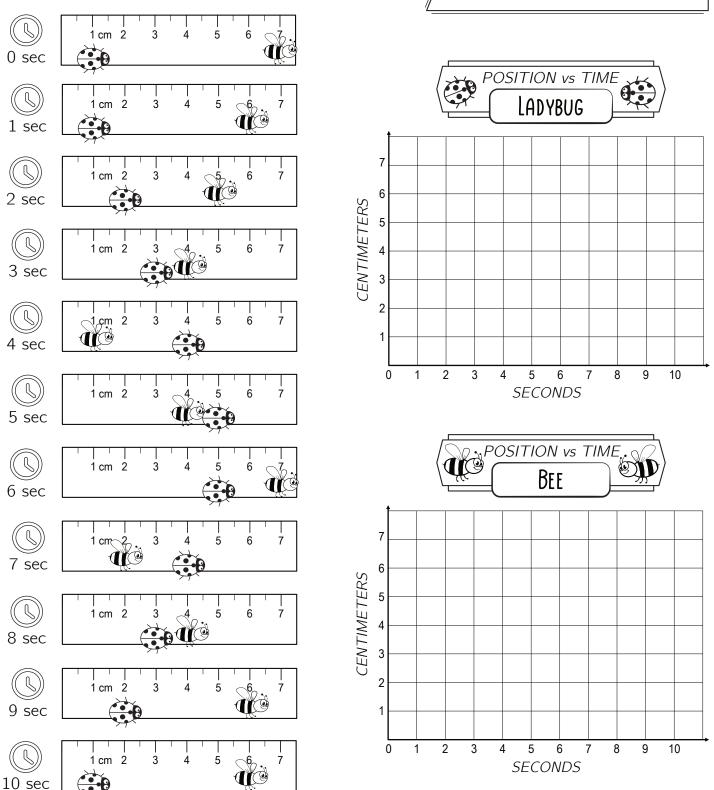

- 4) A car is driving on a freeway at a speed of 100 km/h.
 - A. How far does the car travel in 1 min?
 - B. A blink lasts for about 0.3 s. How many meters does the car travel while the driver blinks?
- 5) The formula showing the relationship between r (rate), d (distance), and t (time) is often written as d = rt. Rearrange the variables to solve for r and t.
- (6)On her bike, Jade travels *n* miles north and then turns around and travels *s* miles south. A. Use s and n to write an expression that shows how far Jade traveled.
 - B. If Jade travels directly north and then turns around and travels directly south, will her **displacement** be the same as the total **distance** traveled?
 - C. Calculate Jade's displacement when n = 4 and s = 7. Then write a sentence explaining what the calculation means.
- (7)A go-kart track has a length of 500 m.
 - A. What is the average speed in m/s of a go-kart that completes 3 laps in 2.5 minutes?
 - B. How many laps would be completed in 4 minutes at an average speed of 8 m/s?
 - C. What is the displacement for a go-kart that has completed 7 complete laps?

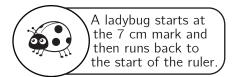

GRAPHING MOTION

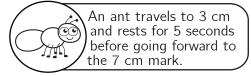

Graphs are useful for sharing information. They let us see a lot of data at the same time and help us understand the relationship between two or more things.

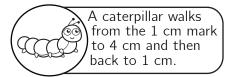

// Graph the movement of the bee and ladybug below with position on the vertical axis and time on the horizontal axis.

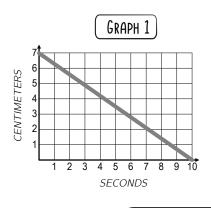

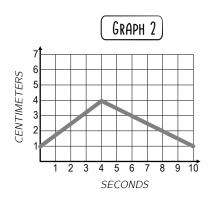

Match the time/position graph with the correct insect:

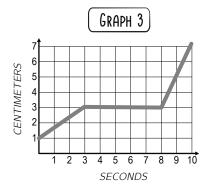

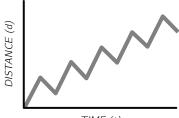

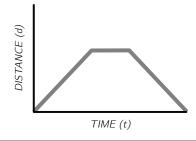

The graphs below represent the position of 3 birds on the ruler. Write a sentence or two describing what each bird is doing.

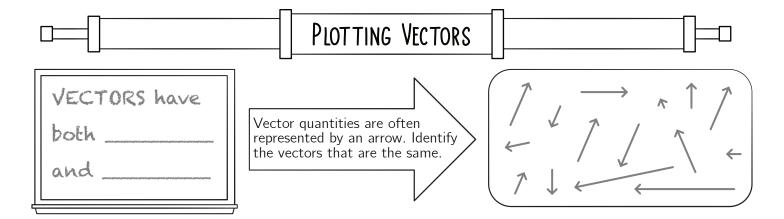

TIME (t)

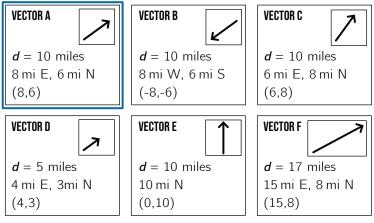

TIME (t)

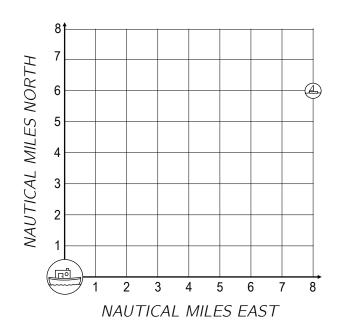

The Coast Guard boat received a call for help from a small boat. Which vector would result in a rescue?

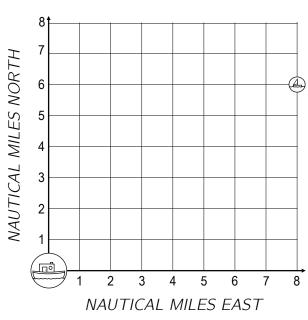

Which vectors have the correct magnitude but the wrong direction?

Which vectors have the correct direction but the wrong magnitude?

Identify 2 or more vectors that the Coast Guard could combine to reach the boat.

PRACTICE PROBLEMS - GRAPHING MOTION

PHYSICS PUZZLES

3

2

0

-1

-2

Position (cm)

Time (sec)

The graph to the right shows the position of an ant walking back and forth across an unusual ruler that includes negative numbers.

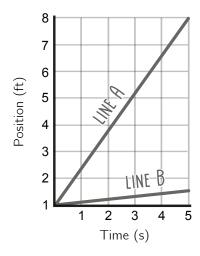

PRACTICE PROBLEMS - GRAPHING MOTION

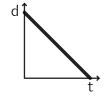

(8) FAST OR SLOW?

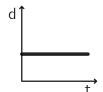

One of these lines represents the motion of a rabbit moving forward very quickly. The other is for a tortoise moving slowly. Which is which and how can you tell?

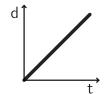

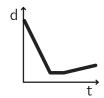

(9) MATCHING GRAPHS:

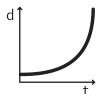

Below are 5 different graphs of distance versus time (which work the same as position vs time graphs). Match each graph with the appropriate description.

THE OBJECT
IS MOVING
FORWARD AT
A STEADY
SPEED

THE OBJECT IS NOT MOVING.

THE OBJECT IS MOVING BACKWARD AT A STEADY SPEED THE OBJECT STARTS MOVING SLOWLY BUT THEN MOVES MUCH FASTER THE OBJECT MOVES BACKWARDS AND THEN PAUSES BEFORE MOVING FORWARD SLOWLY

10 The dots below indicate the distance that a rock falls every 0.25 seconds after being dropped.

How long did it take for the rock to fall 60 feet?

When was the rock falling slowest?

How fast was the rock falling on average from 1 s to 2 s?
